# INTRODUCTION

The Interactive Development System is designed to give users of ICL 1900 computers running under George 1+, 2 or 2+, or 2903/4 computers running under ETS-2 or MTS, the online program development aids usually associated with larger and more sophisticated computers and operating systems. These facilities, further described below, may be included along with applications transactions in a single TPS program, or may be used as a separate free-standing utility program. The major facilities provided by the package are:

- Editing data
- Manipulation of files
- Control of the running of jobs
- Remote printing from spool files.

A full description of the procedures required to include the Interactive Development System along with user applications in a single TPS program is given in Section 5 of this manual.

Details of console operating and the Standard TPS functions available with free-standing Interactive Development System programs are given in the Free-Standing TPS Programs manual.

The remote printing from spool files facility only is also available as a TPS option (i.e. without the remaining IDS facilities). For users of this option, only Sections 1, 6 and 7 of this manual are relevant.

#### 1.1 EDITING DATA

The editor combines comprehensive file addressing commands with the convenience of a screen editor. Four types of file structure are supported, namely:

'Simple' Subfiles - i.e. the structure of COBOL source files

'Composite' Subfiles - i.e. the structure of source files for PLAN and RPG, as well as the "XMED" files used for operating system JCL

Standard serial data files

TPS 'edit files' (described below in Section 1.2)

Editing is achieved by giving the user access to a requested number of records by displaying them on the screen within a "window" of variable size. The ability to change the size of the window allows the user to display a larger number of lines when studying a file and editing it in context, but when making a defined change he can display only the line required, thus reducing the amount of data transmitted in and out, improving his own response time, and making the most economical use of a shared communications line.

The Editor operates by transcribing data from an input file, TPS 'edit file' or window to an output file. The window is used in conjunction with the commands 'Insert,' 'Delete' or 'Replace' to effect the required amendments to the file. Input file records are accessed by 'Position' or 'Transcribe' commands. Both these commands refer to an 'end-point', which can be either a record number or a character string with the record. Only these records that require amendment need be displayed, thus enabling the user to edit the file in a minimum number of screen displays. Editing commands may be used singly or in groups, and in either case may be repeated a specified number of times or to a defined end point.

Full details of the Editing Functions available are given in Section 2 of this manual.

#### 1.2 MANIPULATING FILES

The Interactive Development System contains a set of commands which enable a terminal user to perform the following functions:-

- Allocate, delete, extend or contract a file held on disc.

These functions offer most of the facilities of the standard utility. XPJC, on a single screen display. A file may be allocated a specified block and cylinders. Alternatively, its location may be left to Executive.

Copy the whole or a part of a file held on disc.

The TPS Edit Well, which is an extra TPS file structure introduced with the Interactive Development System, provides the facilities of a small file-store system. The terminal user can create an 'Edit File and add data to it in any format. (Each Edit File can be regarded as a subfile of the Edit Well). Typically, the terminal user might set up operating system job control commands and user data in an Edit File before submitting the job for execution. After creating an edit file and inputting data to it, it may of course be amended, using the Editor. A list of edit files currently within the TPS Edit Well, and the contents of any specified edit file may be displayed on request.

The commands available for File manipulation are fully described in Section 3 of this manual.

# 1.3 CONTROLLING JOBS

The range of commands associated with the control of jobs is designed so that the terminal user can exercise control over the submission of his jobs and gain fast access to any output results.

The job commands are:-

- Copy an edit file to the operating system spool file.
   This enables a job prepared as described above to be submitted for running.
- Display a list of jobs or documents currently within the spool file. This allows the terminal user to check the status of his job, to see if it has been run.
- Copy a spool file job or document to an edit file.
   This gives the terminal user the opportunity to see the results of the running of his job without waiting for a printed output.

It is important to note that although the facilities of the Interactive Development System allow the terminal user to prepare jobs in the most direct manner he is not with this set to facilities able to pre-empt the control of the installation exercised by the central operator or operating system. On the 2903, for instance, he may submit a job, and even send a prompt to the central operator requesting it to be run, but he may not actually initiate the run. This is of great significance in relation to the small installation for which the Interactive Development System is designed, where the injudicious running of a long compilation might well have an undersirable impact on the running or production jobs.

A full description of the commands associated with the control of jobs is given in Section 4 of this manual.

IDS-0480

4.1

(84.2)

# 1.4 REMOTE PRINTING FROM SPOOL FILES

Users of 2903/4 systems, or 1900 users with George 1+, 2 or 2+ systems, frequently have the need to take the output of batch jobs and direct it to printers at remote locations. This is the straightforward bulk output activity which would normally be regarded as an RJE task. In practice, however, looking at it this way will often imply certain disadvantages. It may significantly increase the main store requirement at the CPU, especially if the loading of the RJE utility implies the need for Communications Manager in a system which does not otherwise need it. It may also imply either the need for a second 7502 or the prolonged interruption of interactive work while the output takes place, neither of which may be justifiable if the printed data itself is of secondary importance.

To overcome these problems TPS provides facilities for the output of data from the systems spool files through the online program itself. The original creation of the data by batch programs is not affected in any way; output documents are created just as they are for mainframe printing. Once a document is ready it may be transferred into the TPS print well on the input of a standard request from a terminal. While being transferred its contents are re-formatted for output to the remote printer. It is then stored as a "Stream" in the TPS print system, and all the facilities of that system for requesting its output to one or more printers, along with control functions (suspend, resume, etc.) are available.

The remote printing functions are described in Section 6 of this manual.

#### 2. THE EDITOR

# 2.1 Description

# 2.1.1 Outline

The Editor system comprises of two formats, the first (XEIN) being used to define the input/output files and display requirements.

The second (XEDT) is used to input the edit instructions, amend or delete the displayed lines or insert new ones.

Only those records that require amendment need be displayed, thus enabling the user to edit the file in a minimum number of screen displays.

# 2.1.2 The Window

The window is the device by which records are made available for editing; the number of records needed to fill the window are displayed at any one time. If a record is too long to be displayed on one line, a continuation character of a minus sign (-), is set as the last character of the first line, and the record continued on the next line.

Similarly when inputting a long record the last character of the first line must be set to a minus sign, and the record continued on the next line.

When using the window care must be taken in positioning the cursor at the end of the last line to be sent, to ensure that lines are not lost or inserted inadvertently.

#### 2.1.3 Current line number

The current line number gives the position, relative to the start of the file, of the next input file record available for editing. It is also used as a method of addressing the input file in conjunction with the instructions 'Position' and 'Transcribe'.

# 2.2 XEIN

# 2.2.1 Description

XEIN is used to gain access to the editor system and will require file and screen details to be entered.

After validating the entered fields and successfully opening the input and output files, and the command file if specified, control is passed to the editing format XDT. Once the XEDT screen has been displayed no other message type may be requested until edit has been ended.

If errors are found or the files cannot be opened the XEIN format will be returned with an appropriate error message displayed.

#### 2.2.2 Entered Fields

#### 1. Edit type

This field is mandatory and specifies the type of file to be edited. Four types of file structure are catered for, namely:

Simple file - i.e. COBOL source file

Composite file - i.e. Plan source file

RPG2 source file

XMED files

Record file - i.e. Normal serial data file

(N.B. maximum record length

31 words)

Edit file - i.e. TPS edit file

field format X, where X is one of the following:

S, C, R or E.

#### 2. Input

This field is mandatory and defines the disc file to be edited.

field format - filename (fgn)

filename = name of the input file

fgn = file generation number

Note: The fgn field is optional and may be omitted.

If it is omitted, the associated brackets should also be omitted and the highest generation number on line will be used.

# -3. Output

This field is optional and defines the disc file to accept the edited output.

field format - filename (fgnl = fgn2)

file name = name of the output file

Note: if the file name is omitted the input file name is assumed.

fgnl = generation number of the file to be used.

Note: If fgnl is omitted then fgn2 must also be omitted together with the associated brackets and equals sign.

If filename has been specified then generation zero will be used if fgnl omitted.

If filename has not been specified the default options are described below.

fgn2 = generation number to be given to the
 output file.

Note: This field is not valid for TPS
Edit files. If fgn2 is omitted
the preceding equals sign should
also be omitted and the generation
number will remain unchanged.

Note 1. It is only valid to omit the whole of this field if a file generation number has not been specified for the input file. If no file generation number is specified for the input file the default action, if the whole of this field is omitted, will be as follows:-

i) If the file type is S, C or R the highest generation number online, say 'n', will be opened for input, a file with the same name and generation number n-l will be opened for output and renamed with generation number n+l.

ii) If the file type is 'E' the highest generation number online, say 'n', will be opened for input and a new edit file with the same name and generation number π+1 will be created for output.

- Note 2. If the file type is E it is not recommended that an existing edit file is used for output. This is because existing edit files that have been closed once cannot be extended, or contracted.
- Note 3. An error will occur if the effect of this field is such that the input and output files have the same name and generation number.

# 4. Composite subfile ID

This field is only used when editing Composite structured files i.e. the Edit type is C.

Field format - Subfile/Segment

Subfile = Name of the first subfile to be edited.

Segment = Name of the first segement, contained within the subfile, which is to be edited. This field is optional and may be omitted; if it is omitted the preceding solidus should be omitted. If omitted the first segment within the subfile is edited.

Note: Several segments and subfiles may be edited within a call to the editor; amendments must be input in the order in which the subfiles/segments are present in the input file. Unamended subfiles and segments will be copied to the output file. This field may be omitted; in this case the first segment of the first subfile is amended.

#### 5. Alternative Window Size

Optional field, used to specify an alternative window size for the first screen of data displayed.

Field format-nn

nn gives the number of lines to be displayed in the window.

If the field is omitted the default window size is seven lines less than the number of lines on the screen.

# 6. COBOL Resequencing

This field indicates that COBOL lines are to be resequenced before they are written to the output file. The first line will be numbered 0001000 and subsequent line numbers will be incremented by 100. This option may only be specified for COBOL files.

Field format - Y or N

Y = Resequence COBOL lines

N = Do not resequence.

This field is optional and may be omitted. The default value is N.

#### 7. Command File Name

Force the editor to obey commands from a command file rather than through the XEDT screen. The command file must be an existing TPS Edit File. The commands contained in the command file may not be window instructions, but may be any other valid editor commands. The maximum length within a command file is 40 characters. The commands will be obeyed in sequence, if an invalid command is encountered an XEDT screen will be displayed indicating the error and the point the edit has reached. If the command file does not contain an E command, control will be passed to an XEDT screen when all commands have been obeyed.

Field format - file name (fgn)

File name = name of the TPS Edit file containing

the commands to be obeyed.

fgn = file generation number

Note: If fgn is omitted, the associated brackets should also be omitted and the highest generation on line will be used.

# 2.2.3 Examples

 Edit a COBOL source called SOURCE-TPO1, generation 1. Output to SOURCE-TPO1, generation 0, changing the generation to 2. Resequencing is required. Generation 1 is highest version SOURCE-TPO1 online

Edit type [S]
Input [SOURCE-TOPO]]
Output [ ]
Composite Subfile ID [ ]
Alternative Window Size [ ]
COBOL line Resequencing ? [Y]

8,2

101-2-4.2-1278

 Edit a Plan source called TPS-SOURCE, generation 1. Output to TEST-SOURCE, generation 1 changing the generation to 2.

The input is a composite file with the segment to be edited called VALIDATE contained with a subfile called TPO1.

Change the window size to 10 lines

Edit type [C]
Input [TPS-SOURCE (1)]
Output [TEST-SOURCE(1=2)]
Composite Subfile ID [TPO1/VALIDATE ]
Alternative Window Size [10]

 Edit a TPS Edit file called TPSEDIT1 generation 6, which is the highest generation of this file online. Output to a TPS Edit file called TPSEDIT1 Generation 7 which is to be created.

The edit is to be controlled by the command file, which is a TPS Edit file, called TPSCOMFILE Generation 10.

Edit type [E]
Input [TPSEDIT] ]
Output [ ]
Composite Subfile ID [ ]
Alternative Window Size [ ]
COBOL Line Resequencing?[ ]
Command File Name [TPSCOMFILE(10) ]

#### 2.3 XEDT

# 2.3.1 Description

Editing is achieved by entering Instructions in the instruction field. Several instructions may be entered, each separated by a comma, although multiple instructions that use the window are not recommended.

3 types of instruction exist, namely:

Instructions that use the window, Instructions that address the input file, and miscellaneous instructions.

#### 2.3.2 Window instructions

#### 1. Delete

Format - D

Function - Do not copy the lines currently displayed in the window to the output file.

#### 2. Insert

Format - I

Function - Insert the lines currently displayed in the window onto the output file.

#### Replace

Format - R

Function - Replace the original contents of the window by the new contents.

Note: The window size may need amending if a different number of lines are being replaced than originally displayed.

#### 4. Window

Format - Wn

Function - Change current window size to n.

# 2.3.4 File addressing Instructions

#### 1. Position

Pn Format 1

Position the input file n records from the Function

current line number.

Format 2 P#n

Position the input file to record number n. Function

Format 3 PC/string/

Function Position the input file to a line containing

'String'.

Format 4 PS/string/

Position the input file to a line starting Function

with 'string'.

Format 5 PE

Position to the end of the input file. Function

The position command does not write records to the Note:

output file.

Using format 2 you may position to a point before

the current line number.

#### 2. Transcribe

Format 1 Tn

Copy n records from the input file to the Function

output file.

Format 2 T#n

Function Copy records from the input file to the

output file until record number n is read.

Format 3 TC/string/

Function Copy records from the input file until a

record containing 'string' is encountered.

Format 4 TS/string/

Copy records from the input file to the Function

output file until a record starting with

'string' is encountered.

Format 5 - TE

Function - Copy the remaining input file to the output file.

Note:

When using this Instruction the preceding 'T' may be omitted, except for TE.

Attempted backward 'transcription' will result in an error.

# Replace 'string A' by 'string B'

Format - R/string A/string B/

Function - Within the current record replace string A by string B and write the amended record to the output file.

Note: String A and string B may be of different lengths.

# Replace first occurrence of 'string A' by 'string B'

Format - RF/string A/String B/

Function - Within the current record replace only the first occurrence of string A by string B and write the amended record to the output file.

Note: String A and string B may be of different lengths.

# Introduce Edit File as a Merge File

Format - Mfilename(n)

Function - Switch the input file to the TPS Edit file filename with generation number n. If the generation number is omitted the associated brackets should also be omitted and the highest generation number available will be used. Records may then be transferred from the window to the output file using normal edit commands.

To return to the original input file the command M should be used with no parameter.

The TE or PE commands when a merge file is in use will transcribe or position to the end of the merge file.

The E command when a merge file is in use will transcribe to the end of the merge file and then to the end of the original input file and then end the edit.

When a merge file is in use a search for a string will search only within the merge file.

# -2.3.5 File Addressing Instructions - Composite Files Only

The commands described in this section may be used when editing a composite file in order to edit more than one subfile/segment during one pass of the file. Subfiles/segments may also be deleted, inserted or renamed if required.

Subfiles/segments must be edited in the order in which they appear in the input file. When any of the commands numbered 1 to 6 below are input, the segment currently being edited is copied to the end, before obeying the command. If the specified subfile/segment is not found on the input file, an error message is displayed and the current position in the input file will remain at the end of the segment last edited: the command next entered must then be one of those described in this section.

#### Delete a subfile

Format

- DSF (subfilename)

Function

this may be used to delete the subfile currently being edited, or to delete a subfile present later in the input file. In the latter case any subfiles/segments following the last edited segment and preceding the specified subfile in the input are copied to the output file. The specified subfile is not copied to the output file, and a blank XEDT screen with the message 'SUBFILE DELETED' is displayed. The use of many of the editing instructions at this point will be flagged as "INCONSISTENT' until a new subfile/segment is specified for editing.

#### Delete a segment

Format

DSG (subfile/segmentname)

Function

this may be used to delete the segment currently being edited, or to delete a segment present later in the input file. In the latter case, any subfiles/segments following the last edited segment and preceding the specified segment in the input are copied to the output file. The specified segment is not copied to the output file, and a blank XEDT screen with the message 'SEGMENT DELETED' is

displayed. The use of many of the editing instructions at this point will be flagged as 'INCONSISTENT' until a new subfile/segment is specified for editing.

# 3. Edit a subfile

Format - ESF (subfilename)

Function - Copy to the output file any subfiles/
segments following the last edited
segment and preceding the specified
subfile in the input file. Display
details from the first segment for
editing. (The segment may then be
edited using the standard commands).

# 4. Edit a segment

Format - ESG (subfilename/segmentname)

Function - Copy to the output file any subfiles/
segments following the last edited
segment and preceding the specified
segment in the input file. Display
details from the segment for editing.
(The segment may then be edited
using the Standard commands).

# 5. Insert a subfile

Format - NSF (subfilename) or NSF (subfilename/segmentname)

illegal.

Function Copy to the output file the remainder of the subfile currently being edited. Display a blank XEDT screen with the message 'START OF NEW SEGMENT'. The first segment of the new subfile is then input, using the Insert (I) or Merge (M) instructions (the merge instruction allows the new segment to be input into an edit file initially). If no segment name is specified, a name of spaces is used. Note that if a PLAN segment is inserted the first line of the segment must be a #STEER statement. If this is ommitted, any attempt to compile the segment is likely to result in the compiler going

12.2

101-2-8.2-0379

# Insert a segment

Format - NSG (subfilename/Segmentname)

Function

This command allows the insertion of a new segment into the subfile currently being edited, or into a subfile present later in the input file. A segment inserted into the current subfile is inserted following the current segment. For a segment inserted into a subsequent subfile, any subfiles/segments following the last edited segment and preceding the specified subfile in the input are copied to the output file; the new segment is inserted at the start of the specified subfile. In either case a blank XEDT screen with the message 'START OF NEW SEGMENT' is displayed. The new segment is then input, using the Insert (I) or Merge (M) instructions (the merge instruction allows the new segment to be initially input into an Edit file). Note that if a PLAN segment is inserted the first line of the segment must be a #STEER statement. If this omitted, any attempt to compile the segment is likely to result in the compiler going illegal.

# 7. Rename a subfile

Format - RSF (subfilename)

Function - give the subfile currently being edited the new name specified on output. The current pointers to the input and output files are not altered.

#### 8. Rename a segment

Format - RSG (segmentname)

Function - give the segment currently being edited the new name specified on output. The current pointers to the input and output files are not altered.

# 2.3.0 Miscellaneous Instructions

#### 1. End

Format

E

Function

Copy the remaining input file to the

output file and end the edit.

#### 2. Forget

Format

Function

Forget the previous instructions and reinstate the files and window to their position prior to the instructions being carried out.

Successive use of this command is not supported.

#### 3. Maximum Line Length

Format

Ln

Function

Truncate output records to n characters. The maximum value and default value for n is 120 characters.

#### 4. Omnibus Character

Format

On

Function

Specifies that the character n is to be treated as an omnibus character when it occurs within a string. This character, when used in strings which are to be compared to the text of the input file, is matchable with any character in the input file text.

A parameterless O instruction will cause any previous omnibus character to be forgotten without substituting a new one. The omnibus character may not be a space or a comma.

For example if '\*' is specified as the omnibus character then the string /A\*\*B/ would match any string with A as the first character and B as the fourth character.

12.4

# 5. Quit

Format - C

Function - Abandon the edit

If a TPS Edit file is being edited the output file will be erased

#### 6. Repeat edit

Format 1 - (edit Instructions) \*n

Function - Repeat the edit instructions enclosed

within the brackets n times.

Format 2 - (edit Instructions) E

Function - Repeat the edit instructions enclosed within the brackets until the end of the input file.

# 2.3.7 'String' Instructions

The user may enclose the 'string' within any character other than a space or comma.

The length of the 'string' is restricted to what can be contained within the next instruction field.

# 2.3.8 Long records

The maximum record length that may be processed by the editor is 120 characters. Any record found to be greater than this maximum will be truncated and a warning given.

# 2.3.9 Editing of serial data files

Note that the maximum length of records which may be edited is 31 words. If longer records are encountered on the input file these are truncated when displayed. Also data records which are to include trailing spaces may not be successfully processed by the editor, as this removes trailing spaces from all records entered via the window (trailing spaces are not removed by 'transcribe' commands).

# 2.3.10 Editing PLAN Source files

For PLAN source files, the first record in each subfile contains the steering information. This is in the form of a 21-word record with '#STEER' as the first 6 characters following the the word count, and steering information starting in the 16th character after the word count. This record is displayed as the first line of any subfile being edited; the user should specify the appropriate steering information from column 16 onwards. For subfiles which are copied to the output without editing, if the first record in the subfile is 21-words long,

beginning with '#STEER', the steering information is removed by spacefilling from the 16th character aften the word count to the end of the record. When inserting a new subfile, the user must ensure that the first line specifies the steering information, and begins #STEER (or #STE, which is converted to #STEER on the output record).

The editor does not check for the presence of steering information, as the single filetype 'Composite' also includes files which do not require steering details (e.g. 'XMED' files). Unpredictable results may occur if a file for which the steering line has been removed completely is submitted to a program expecting PLAN source file format input. Note that TPS source files conform to PLAN source format and require this steering line.

Message

1. End of input

# 2.4 Warnings and Errors

Warning and error conditions may occur at any time during the running of an edit. Where possible the user is invited to correct the error and continue the run. Other errors can arise as a result of a system or file failure and may cause the edit to be abandoned.

Reason

The input file is at end.

# 2.4.1 Warnings

2.4.2

2.	Input records truncated	A record in excess of 120 characters has been truncated.
XE	IN Errors	
	Message	Reason
1.	Invalid data	An input field is in error. The cursor is positioned at the start of the offending field.
2.	Insufficient data	A mandatory field has been omitted.
.3.	Inconsistent Data	An input filename and generation number have been specified, but the output file field has been omitted.
4.	Input file fail	The input file cannot be opened because of:
		A Non-existent file
		B Not enough executive store
		C Integrity code failure
		D Transfer failure
5.	Output file fail	The output file cannot be opened because of:
		A Non-existent file
		B Not enough executive store
		C Integrity code failure
		D Transfer failure
6.	Wrong input file type	The input file is of a different type to that specified.
7.	>1 input subfile	The input file is of composite file structure with more than one subfile and no subfile identity specified.

		Error	Reason
	8.	Subfile not found	The specified subfile cannot be found
	9.	No store for input	No suitable store cell exists within the program for input file buffering.
	10.	No store for output	No suitable store cell exists within the program for output file buffering.
	11.	User TCR too small	The user TCR within the current system is too small to support the editor.
2.4.3	XEDT	Errors	
	1.	Backwards?	An attempt has been made to transcribe backwards through a file.
	2.	'F' not allowed	An attempt to 'Forget' has been made in an invalid situation.
	. 3.	Invalid data	An unrecognised instruction has been entered.
	4.	Invalid number	An invalid numeric end-point has been entered
	5.	Edit abandoned	The 'quit' instruction has been given.
	6.	Output file not large enough	The output file is too small to hold the edited output.
	7.	Message area too small	The specified window size is too large for the current system.
	8.	Input file fail	The input file has failed.
	9.	Output file fail	The Output file has failed.
	10.	No store for O/P	The system does not have a suitable store cell for use in creating the output text for the window.
	11.	Subfile not found	The specified subfile is not present in the input file.
	12.	Segment not found	The specified segment is not present in the specified subfile on the input file.
	13.	Inconsistent data	The specified instruction is not valid at this time (when editing a Composite file), or with this file type.

#### 3. FILE HANDLING

#### 3.1 Outline

The utilities that constitute the file handler consist of several discrete routines, each performing an independent function

The routines and their specific functions are as follows:

ZFLC Allocate, delete, extend or contract a file on disc.

XIMS, XIEN Create and input to a TPS Edit File.

XILE Display the contents of a TPS Edit File.

XIFU Function C Copy a disc file

Function E Display status of TPS Edit Files

Function R Delete TPS Edit File

Access to a specific routine is gained by requesting its 4 character format identifier.

#### 3.2 Edit Well

The TPS Edit Well is an interactive operator internal file whose subfile or Edit Files, as they are called, may be created, amended or copied from and to, using File and job handling routines and the editor.

Typically the user would create and input to an Edit File the required job control commands and local data necessary to run a job. Also create and input any global documents that may be required.

We will see in the next section how having created these files they are made available to the operating system.

#### 3.3 Local documents

Documents included within a job are considered to be LOCAL.

All the documents required by the job may be included, each one contained within a document header and the declared terminator.

# 3.4 Global document (2903/4 System only)

A global document consists of one document enclosed within its document header and terminator.

An optional field following the document name defines the number of accesses that may be made to the document before it is erased. If this field is omitted a default of 1 access is assumed.

# Example

Doc documentname

- 1 access only

Doc documentname, A10

Erase the document after 10 access

Doc documentname, P

Permanent file. Erase by operator action.

#### 3.5 ZFLC

#### 3.5.1 Outline

This routine provides 6 basic functions.

- A Allocates a file of specified size anywhere on a given cartridge.
- C Allocates a file of specified size to particular cylinders and blocks on a given cartridge.
- D Deletes a file.
- E Extends or contracts a file.
- L Lists details of a file
- R Renames a file
- S Sets End of File tag

Normal ICL file allocation conventions apply, namely:

File name - up to 12 alphanumeric characters, the

first being alphabetic.

Fgn - generation number in the range 0 - 4095.

Retention - number of days in the range 0 - 4095.

Period

Integrity code - 1, 2 or 3.

Bucket size - 1, 2, 4, or 8 blocks.

Cylinders and blocks are numbered from zero.

Start block must be a multiple of 8.

End block must be a multiple of 8 minus 1.

3.5.2 Function A Allocate a file of a given size anywhere on the specified cartridge.

#### Entered fields

#### Mandatory

- 1. Function A
- 2. File name Name of the file to be allocated.
- 3. Fgn Generation number to be given to the file.
- Csn Serial number of the cartridge the file is to be allocated on.
- 5. No. buckets The number of buckets the file is to be given.

#### Optional fields

- Bucket size Blocks per bucket. (1, 2, 4 or 8)
   If omitted, 1 block buckets assumed.
- Bucket headers Size of bucket headers in words.
   If omitted, 2 word bucket headers assumed.
- Integrity code Integrity code for the file.
   If omitted, 1 assumed.
- File retention Retention period to be given to the file. If omitted, zero assumed.
- Data retention Retention period to be given to the data. If omitted, zero assumed.

Note: This field should only be used when re-allocating a file over existing data that is to be protected.

- File type Type of file to be allocated.
  - S Serial
  - Q Sequential
  - R Random

If omitted, S assumed.

- Record V/F Type of record.
  - F Fixed length V - Variable length

If omitted, V assumed.

- Flaw action Action to be taken in the event of flaws.
  - P Program action E - Executive action If omitted, E assumed.
- Max. record length Maximum length of record.
   If omitted bucket length less bucket header length is assumed.

10. Key length - Length of Key in characters.
 If omitted, zero assumed.

 Key displacement - Number of characters preceding the Key. If omitted, zero assumed.

 LBN of 2nd level O/F - The number of first 2nd level overflow bucket. If omitted, zero assumed.

# 3.5.3 Examples

- Allocate a file called TRANSFILE, generation 0, on cartridge 100.
   File size is to be 296 1 block buckets. All other fields can be assumed.
- 2. Allocate a file called MASTERFILE, generation 1, on cartridge 123. File size is to be 740 4 block buckets with 2 word bucket headers. Set the integrity code to 3 and the file retention to 365. The records are held sequentially and are variable length, up to a maximum of 300 words. The Key starts in character 5 and is 8 characters long. Flaws are to be monitored by executive and record level overflow starts in bucket 666.

3.5.4 Function C Allocate a file of a given size to particular cylinders and blocks of the specified cartridge.

#### Entered fields

# Mandatory

Function - C

File name - Name of the file to be allocated.

 Fgn - Generation number to be given to the file.

 4. Csn - Serial number of the cartridge on which the file is to be allocated.

5. Start cylinder - The cylinder on which the file starts.

End cylinder - The cylinder on which the file ends.

Start block - The block on which the file starts.

End block - The block on which the file ends.

# Optional

Bucket size - Blocks per bucket (1, 2, 4 and 8)
 If omitted, 1 assumed.

Bucket header - Size of bucket headers in words.
 If omitted, 2 word bucket headers assumed.

Integrity code - Integrity code for the file.
 If omitted, l assumed.

 File retention - Retention period to be given to the file. If omitted, zero assumed.

 Data retention - Retention period to be given to the data. If omitted, zero assumed.

Note: This field should only be used when re-allocating a file over existing data that is to be protected.

File type - Type of file to be allocated.

S - Serial Q - Sequential

Q - Sequencia

R - Random

If omitted, S assumed.

7. Record V/F - Type of record

F - Fixed length V - Variable

If omitted, V assumed.

8. Flaw action - Action to be taken in the event of flaws.

P - Program action E - Executive action

If omitted, E assumed.

- Max. record length Length of record.
   If omitted, bucket length less bucketheader length is assumed.
- Key length Length of Key in characters.
   If omitted, zero assumed.
- Key displacement Number of characters preceding the Key.
   If omitted, zero assumed.
- 12. LBN of 2nd level The number of the first 2nd level overflow bucket.

  If omitted, zero assumed.

#### 3.5.5 Examples

- Allocate a file called SORTFILE, generation 0 on cartridge 100. File size is 595 1 block buckets, using blocks 0 to 295 of cylinders 20 and 21.
- 2. Allocate a file called SALESLEDGER, generation 1, on cartridge 404. File size is 1110 8 block buckets using blocks 0 to 295 of cylinders 100 to 130. Set the integrity code to 2 and the file retention to 100. The records are held sequentially and are variable length up to a maximum of 620 words. The key starts in character 9 and is 10 characters long. 2nd level overflow starts in bucket 1036 and flaws are to be monitored by executive.

# 3.5.6 Function D Delete a file

## Entered fields

### Mandatory

1. Function - D

2. File name - Name of file to be deleted.

 Fgn - Generation number of the file to be deleted.

 4. Csn - Serial number of the cartridge holdithe file description.

# 3.5.7 Example

 Delete the file PRINTFILE, generation 1, from cartridge 100.

### 3.5.8 Function E

Extend or contract a file

### Entered fields

#### Mandatory

1. Function

- E

2. File name

Name of file to be extended/contracted.

3. Fgn Generation number of file.

4. Csn Serial number of cartridge holding the file description.

5. No. buckets

Number of buckets the file is to be extended by. Positive number for extension. Negative number for contraction.

## 3.5.9 Examples

- 1. Extend the file SALESLEDGER, generation 1, on cartridge 300, by 32 blocks.
- 2. Contract the file SALESTATS, generation 10, on cartridge 404, by 296 blocks.

3.5.10 Function L

List file details

# Entered fields

#### Mandatory

1. Function - L

2. File name - Name of file which is to be described

Fgn - Generation number of file

 Csn - Serial number of cartridge holding the file description.

Note: The number of file areas occupied by the file is reported on the screen after the End Block field. If the file consists of more than one file area only the details of the location of the first file area are displayed.

30.2

101-3-16.2-1278

# 3.5.11 Function R Rename a file

## Entered fields

# Mandatory

1. Function - R

File name - Name of the file which is to be renamed

Fgn - Generation number of file

 Csn - Serial number of cartridge holding the file description.

 New Filename - The new file name and generation number and FGN to be given to the file.

# 3.5.12 Function S Set End of File Tag

### Entered Fields

## Mandatory

1. Function - S

 File name - Name of the file which is to have its end of file pointer reset

Fgn - Generation number of file

 4. CSN - Serial number of the cartridge holding the file description

5. EOF

- Value to be given to the end of file tag.

NOTE: this is the value used by exec when a request is made to open the file 'AT END'. An end of file bucket is not written to the file, nor is any check made that the end of file tag value specified points to an end of file bucket.

101-3-17-1278

31

# 3.5.12 Errors

Two types of error can arise, the first being in response to fields entered in error, the second in the form of executive replies to a request.

# Field Errors

Message		Reason
Field missing	-	A mandatory field has been omitted.
Invalid data	1000	An invalid field has been input. The cursor is positioned at the start of the offending field.
Inconsistent data	*	Fields have been input that are not required for this function.
Unable to proceed at present	-	The limit on the number of files executive can handle at any one time has been reached.

#### Executive Errors

Executive errors are displayed as codes preceded by the message 'Error reply - level 1 code #'.

The codes are the circumstances in which errors can occur are as follows:

Opening a file		Reason
4401	-	File not in system.
4402	**	Integrity code failure.
4403	-	Insufficient executive main store.
4404 Cax	ndg	Purge date not exceeded/ <del>Cartridge</del> not online.
Creating a file		
4410	-	System control area full.
4411	-	File already exists.
4413	-	Insufficient executive main store.
4416	-	Cartridge not online.

Extending/contracti	ng	
a file		Reason
4420		System control area full.
4421	-	No space available
4423	ine.	Insufficient executive main store.
4426	-	Cartridge not online.
442\$2	-	Requested number of blocks are not available.
Extended into area		
4430	-	System control area full.
4431	-	Part or whole area is assigned.
4433	-	Insufficient executive main store.
4434	-	Invalid area.
4436	-	Cartridge not online.
Deleting a file		
4444	-	De-allocating retention period greater than data retention period.
Rename a file		
4450		System control area full.
4453	-	Insufficient executive main store
4457	-	The requested unit has its System file open for writing

# 3.6 Edit stream creation and input

### 3.6.1 Outline

Two routines are used to create and input to a TPS Edit File.

The first XIMS creates the TPS Edit File and makes it available to the second XIEN which is used to input the required job and/or data lines.

The first line of the input should be either a Job or Doc command.

Job implies the following lines are operating system commands with optional local documents.

Doc implies a global document with the following lines being the data contained within the document.

The Job or Doc commands may be omitted in the case where the TPS Edit File is to be submitted for printing only, in which case a dummy Job and Doc will be generated by the copying routine.

The maximum length of any line acceptable as input is 120 characters and any line found to be greater than this maximum will be truncated.

If a line to be input is longer than the screen size allows, the last non-space character of the first line must be set to a continuation character of a minus sign (-) and continued on the next line.

34

101-3-20-0578

### 3.6.2 XIMS

Function - Create a TPS Edit File.

# Entered fields

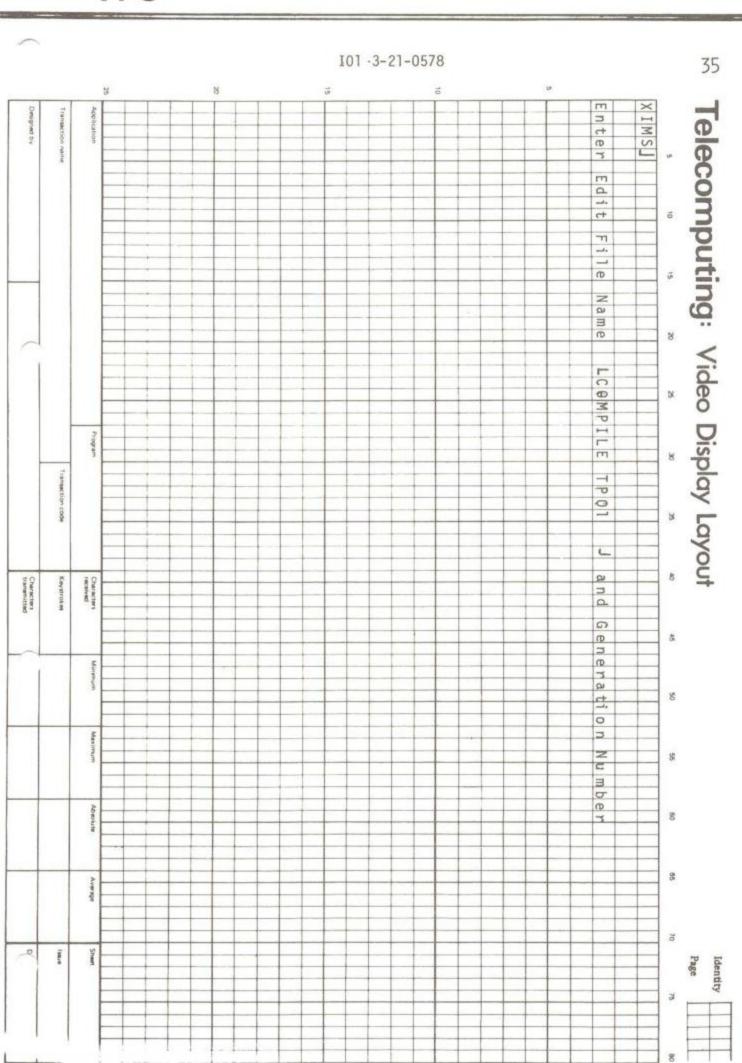

# Mandatory

Edit File name - The name to be given to the Edit File.

Generation number - The generation number to be given to the file.

# 3.6.3 Example

Create a TPS Edit File called COMPILETPO1, generation 1.

101 -3-22-0578

### 3.6.4 XIEN

Function - Input to a TPS Edit File

# Entered fields

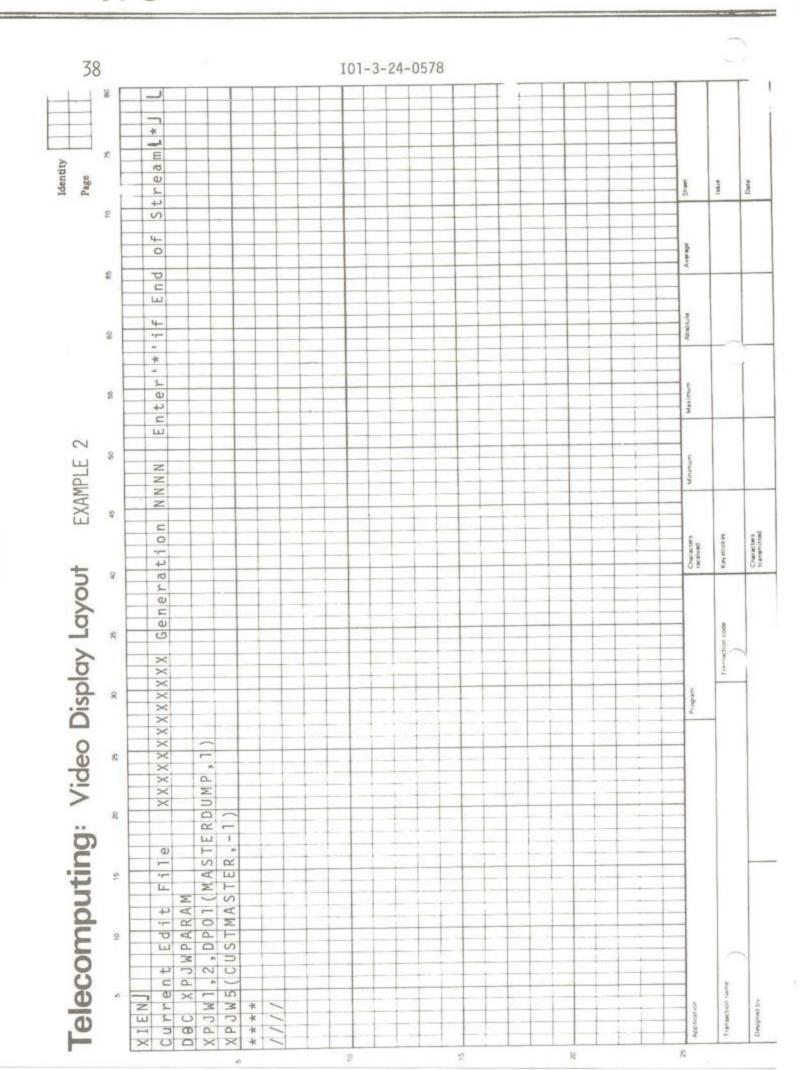

### Optional

- End of data enter \* if this screen is the last to be sent for this input.
- 2. Data Any format.

### 3.6.5 Examples

- Input a job to a TPS Edit File, for which this screen is the last to be sent.
- Input to a TPS Edit File a global document, for which this screen is the last to be sent.

# 3.6.6 Errors

Message		Reason
Inconsistent data	-	A screen has been sent containing no data or end of data indicator.
No suitable store cell	-	No suitable store cell exists within the current system for output file buffering.
Field missing	-	A mandatory field has been omitted.
Invalid data	-	An invalid field has been entered. The cursor is positioned at the start of the offending field.
File already exists/ already open	-	A file with the same name and generation is already in existence.

40

101 -3-26-0578

# 3.7 Edit File display

#### 3.7.1 Outline

This routine will display the contents of a specified TPS Edit File.

### 3.7.2 XILE

# Entered fields

### Mandatory

- File name The name of the file to be displayed.
- 2. Generation number The generation number of the file.

### Optional

 Next line number - This field is updated by the routine for continuation screens, or may be changed by the user to an 'E' to end the display.

# 3.7.3 Example

1. Display the contents of COMPILE TP01, generation 1.

41 101-3-27-0578 8 12 \* \* Telecomputing: Video Display Layout 0 0 0 0 ×C \* X C m LEJ Z 0 4 \* 0 ×  $\varpi$ -\* 00 гп 0 D 0 20 Z m 0 Θ P m 3 Z 0 0 D IL \_ IT D S S ш D П B  $\dashv$ IL 3 0 S 01, 1 0 70 70 < 0 mr ш  $\Box$ D ~ 0 3 7 P 70 --1 I 0 0 P 7,1 0 0 ш 0 3 C 0 0 ST IL N B Z A ш 3  $\dashv$ m DZ Program -0 -1 - 0 Θ Θ T P 5 m D 1 Z Z 0 \_ Z S 0 0 T N Characteri 7 AM T m 4 m m × 8 Maximum Z 55 ш Z 0 Absolute g -Average 5 Ê 57 8

# 3.7.4 Errors

Message		Reason
File name invalid	-	The file name is invalid
File name missing	-	The file name has not been entered
Generation invalid	-	The generation number is not numeric or in the range 0 - 4095.
Generation missing	-	The generation number has not been en 'ed.
Line number missing	-	The line number is not numeric.
Specified record not on file	-	The specified line number is beyond the end of the file.
File already open	-	The file is currently being used.
No suitable store cell	-	No suitable store cell exists within the current system for file buffering.
File does not exist	-	A file of the specified name and generation number does not exist.

# 3,8 XIFU

### 3.8.1 Outline

The function XIFU provides several facilities of which five are of interest in this section:

- display the contents of a TPS Edit Well (in conjunction with function XIGY)
- copy a disc file to a specified file of the same type and bucket size.
- delete a TPS Edit File
- copy a print stream from a User or TPS Print Well to an Edit File
- copy an Edit File

#### 3.8.2 XIFU

Function E Display the contents of a TPS Edit Well.

#### Entered fields

# Mandatory

1. Function required - E

#### Optional

- Edit File name The Edit File name from which the list is to commence.
- Generation The generation number of the file.

Note: Can be used for continuation screens or enquiring on a specific file.

# Processing

The list of edit files is displayed on format XIGU. If there are more than 36 edit files present, a continuation screen may be obtained by pressing 'send' following the display. (The presence of more than 36 edit files is indicated by the display of details in the unprotected fields on screen XIGU).

# 3.8.3 Example

1. Display the contents of the TPS Edit Well.

### 3.8.4 XIFU

Function C Copy a file to a specified output file.

### Entered fields

## Mandatory

- 1. Function required C
- File name 1 The name of the file to be copied
- Generation 1 The generation number of the file
- LBN 1 Number of the bucket on the input file from which copying is to commence.
- 5. File name 2 The name of the output file
- Generation 2 The generation number of the file.
- LBN 2

   Number of the first bucket on the output file at which copying is to commence.

# Optional

Number of buckets - 1. The number of buckets to be copied

or - 2. 'T' copy the file until the output file is full.

or - 3. Not present Copy the whole of the input file.

Notes: 1. A report containing the start and end bucket for both Input and Output Files will be displayed after a successful copy.

 The end of file tag of the output file is set to that of the input file after a successful copy. This may be reset if required, using function ZFLC (see Section 3.5.12).

#### 3.8.5 Examples

- Copy 740 buckets of CUSTMAST generation 1 to TESTCUST generation 10. The input and output start buckets are 1.
- Copy the file SALESTATS generation 20 to REGIONSALES generation 5. Start copying from bucket 12 of the input file to bucket 1 of the output file and continue until the output file is full.
- Copy all of the file WAGEMAST generation 10, to WAGETEST generation 1. Start copying from bucket 1 of the input file to bucket 6 of the output file.

Function P Copy a print stream from a User or TPS Print Well to TPS Edit File

# Entered fields

# Mandatory

Function required - P

 Print stream name - the identifier of the print stream to be copied

 Logical File Number - the logical file number of the User of TPS Print Well containing the print stream.

4. Edit File Name - the name of the Edit File into which the print stream is to be copied.

 Generation - the generation number of the Edit File.

# 3.8.9 XIFU

Function F Copy TPS Edit File

Generation 2

# Entered fields

# Mandatory

Function required - F
 File name 1 - the name of the Edit File to be copied
 Generation 1 - the generation number of the Edit File to be copied.
 File Name 2 - the name of the ouput Edit File

- the generation number of the

output Edit File

# 3.8.10 <u>Errors</u>

Message		Reason
Field missing	-	A mandatory field has been omitted.
Invalid data	-	An invalid field has been input. The cursor is positioned at the start of the offending field.
Insufficient data	-	A field necessary for this function has not been entered.
Inconsistent data.	-	Fields have been input that are not required for this function.
No free LFN	-	The limit has been reached on the number of files that can be handled at any one time.
No suitable store cell	-	No suitable store cell exists within the current system for file buffering.
File unavailable	-	The edit or spool file is currently unavailable.
File in wrong format		The input and output files are of a different type or bucket size.
File missing	-	The requested file does not exist.

#### 4. JOB HANDLING

# 4.1.1 Outline

This section describes how, having created the necessary files, a job and associated data is submitted to the operating system for execution. It also describes how the contents of the spooling files may be examined or returned to a TPS Edit file if required.

The specific routines and their functions are as follows:

XICY - Copy a TPS Edit File to the spool file as an input job, output job or, on 2903/4 systems. a global document.

 Display a list of current input jobs, output jobs, or, on 2903/4 systems, global documents.

XISY - Copy spool file job or global document to a TPS Print Well or TPS Edit File.

 XIIP - Display the contents of a job or document contained in the spool file.

# 4.1.2 2903/4 Systems

### 4.1.2.1 Spool file

The spool file is the file used by the operating system to hold all the jobs and documents waiting to be or being acted upon.

Three distinct types of system requirements are hold on the spool file, namely:

Input jobs

Output jobs

Global documents

# 4.1.2.2 Input jobs

An input job can be considered to consist of the job control statements and associated local documents.

Any request for input for which a local document was not supplied will cause the spool file to be searched for a global document of the requested name.

Failing this, the required document will be read on line.

When an input job is completed the job and associated local documents are erased from the spool file.

# 4.1.2.3 Output jobs

Output jobs contain the output from a job, typically in the form of print lines preceded by the identifying document header. Card and paper tape punch documents will also be included, if not produced online.

The output job will automatically be erased after being printed or punched as the case may be.

#### 4.1.2.4 Global document

A global document consists of input or output data from a job enclosed within its document header and terminator and will be erased by the system when the predefined number of accesses has been reached.

# 4.1.3 George 2 systems

# 4.1.3.1 Input jobs

Input jobs on the George 2 operating system are held within a number of files known as input wells. When TPS is attempting to submit a job or a batch of jobs to George 2 the system will be searched for an empty input well and the jobs copied across. When the jobs have been successfully copied the input well will be renamed such that it is available for use by a George 2 Central Module. All jobs copied by a single iteration of XICY will constitute a single batch and will go into one input well.

### 4.1.3.2 Output Jobs

Output from jobs processed by the George 2 central module is held within files known as output wells. These files are then picked up by the George 2 output module(s) and output to the relevant peripheral. When asked to display or copy and output job TPS will search all available output wells for the specified job.

# 4.1.4 George 2 + Systems

#### 4.1.4.1 Input Jobs

Input jobs on the George 2+ operating system are held within a

number of files known as input wells which are allocated dynamically. When TPS is submitting a job or a batch of jobs to the operating system TPS will interrogate the High Level Scheduler file to determine the next free input well generation number. A single job will be copied into each input well set up in this manner until all jobs have been copied. Appropriate entries will be made in the HLS file.

# 4.1.4.2. Output jobs

Output jobs from the George 2+ system are handled by TPS in the same way as output jobs from George 2 as described in Section 4.1.3.2 above.

Note: On George 2 or George 2+ systems if input and output jobs are to be copied on the same XICY screen all input jobs must preced any output jobs. If this is not the case "INCONSISTENT DATA" will be reported.

56

I01-4-4-1179

### 4.2 XICY

# 4.2.1 Description

Function Copy TPS Edit Files to 2903/4 Spoolfile or George 2 or George 2+ Input or Output Well.

Format
There are three versions of the XICY format:
for 2903/4 Spoolfile, for George 2 and for
George 2+. These are shown on the following
page.

#### Entered Fields

#### Optional

- H.L.S. in use? George 2+ systems only Enter 'Y' if the High Level Scheduler is used in the system. Otherwise enter 'N' or leave the field blank.
- 2. Inhibit Central Output? George 2, George 2+ Systems only. Enter 'Y' if output from the job being submitted is not to be printed by the output module. Leave field blank or enter 'N' if the output is to be printed by the output module.
- Console display Operator's message: any format.
   The specified message is displayed on the operator's console on successfully completing the copy.

#### Mandatory

- File name The name of the TPS Edit File to be copied
- Generation Number The generation number of the TPS Edit File. -l indicates the highest generation of the file in the Edit Well 'should be used.
- Request type Type of request

I - Input job

G - Global Document (2903/4 Spoolfile only).

0 - Output Job (George 2, George 2+ only)

These three fields are repeated for each TPS Edit File to be copied. The cursor should always be left immediately after the last completed field.

## 4.2.3 Errors

Errors can occur as a result of fields entered invalidly, or a file being unavailable or in error.

Where possible the error message is displayed alongside the offending line.

Message		Reason
Field missing	-	A mandatory field has been omitted.
Invalid data	-	An invalid field has been input. The cursor is positioned at the start of the offending field
Spool file inaccessible	-	The spool file is currently unavailable.
File does not exist	-	An Edit File of the specified name and generation number does not exist.
Spool file full	-	The limit on the number of entries that can be held on the spool file has been reached.
Invalid data within job/document	7	The Edit File is of a different type to that specified, or the Doc or Job command is invalid.
Unable to proceed at present	-	G2+ System only - TPS is currently unable to open HLS file. A subsequent input will probably be successful.
User TCR too small	-	The user TCR is not large enough to contain all the input data.
Inconsistent Data	-	G2 or G2+ Systems only. Input and Output jobs have been intermixed on one XICY screen.

101 -4-6-1278

#### 4.3.1 XIFU

Function

Display a list of jobs or global documents currently within the spool file.

#### Entered fields

#### Mandatory

1. Function required - Type of enquiry

> I - List of input jobs 0 - List of output jobs G - List of global documents. (2903/4 Systems only)

#### Optional

1. Job/document name

- The job or document name from which the list is to commence.

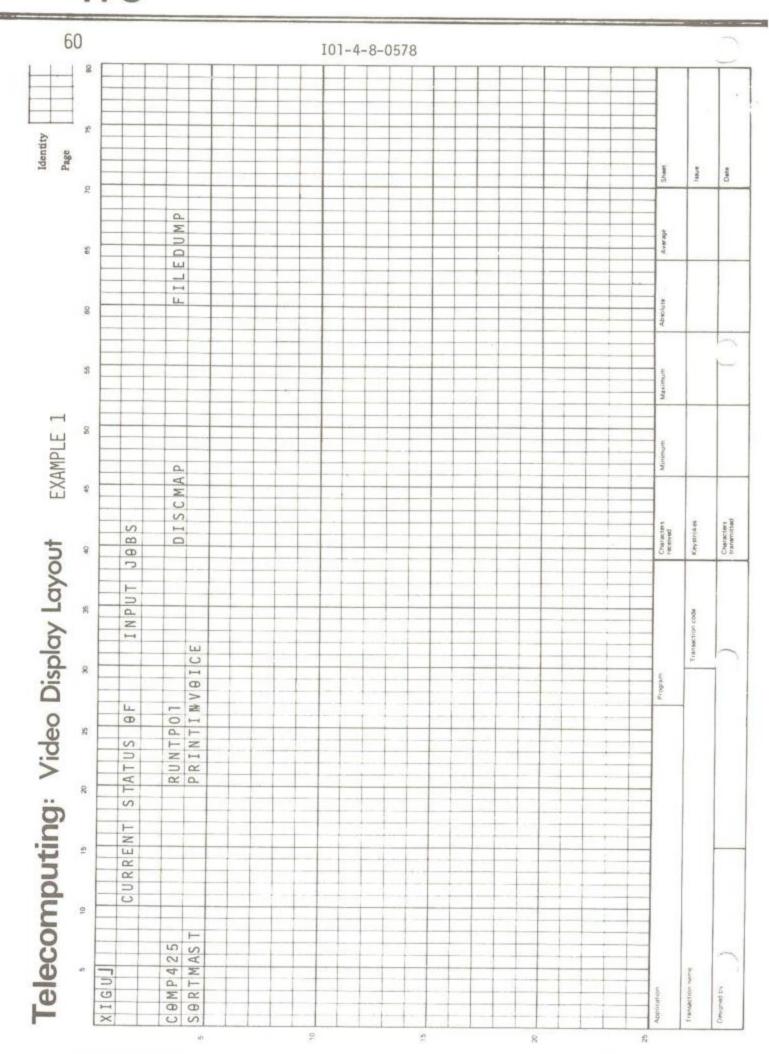

Note: Can be used for continuation screens or enquiring on a specific file.

The output from a XIFU display request is returned on the XIGU screen format.

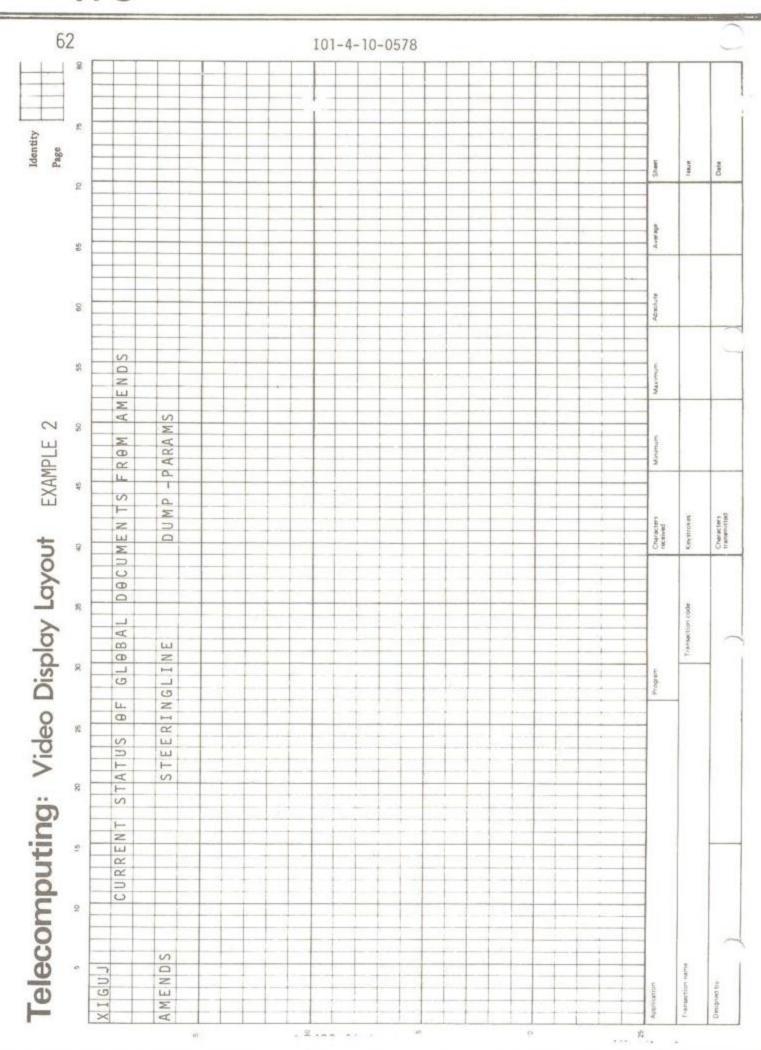

#### 4.3.2 Examples

- 1. Display a list of input jobs currently within the spool file.
- Display a list of global documents currently within the spool file commencing with AMENDS.

## 101-4-11-0578

# 4.3.5 Errors

Message	Reason						
Field missing	-	A mandatory field has been omitted.					
Invalid data	-	An invalid field has been input. The cursor is positioned at the start of the offending field.					
Insufficient data	-	A field necessary for this function has not been entered.					
Inconsistent data	-	Fields have been input that are not required for this function.					
No free LFN	=	The limit has been reached on the number of files that can be handled at any one time.					
No suitable store cell		No suitable store cell exists within the current system for file buffering.					
File unavailable	-	The TPS Edit Well or spool file is currently unavailable.					
File missing	-	The requested Edit File does not exist.					

101-4-12-1179

#### 4.4 XISY

## 4.4.1 Description

Function Copy a job or document from the Spoolfile or a George 2 or George 2+ Input or Output Well into a TPS Edit File

Format There are two versions of the XISY format: one for 2903/4
Spoolfile and one for George 2 and George 2+ systems. These
are shown on the following page.

## Entered fields

#### Mandatory

- Document or job name The Spoolfile (or George 2/George 2+ Input/Output) document or job name.
- Logical File No. The logical file number of the TPS Edit Well as allocated at system generation time.
- Request type Type of entry to be copied.

G - Global document (2903/4 Spoolfile only)

I - Input job
0 - Output job

### Optional

- 1. File ID to be given The name of the Edit File that is to be created to receive the input; if omitted an Edit File is created with the document or job name specified. The created file is given a generation number of zero.
- Number of line ups this field should always be left blank when copying to a TPS Edit File.
- Device type

   this field should always be left blank when copying to a TPS Edit File
- 4. Inhibit Central Output?- George 2, George 2+ Systems only.

  Enter 'Y' if output from the job being copied to the Edit Well is not to be printed by the output module. Enter 'N' if the output is to be printed by the output module.

  The output print status of the job remains unaltered if this field is left blank.

101-4-13-1179

#### 4.4.2 XISY formats

2903/4 Spoolfile

```
COPY A JOB OR DOCUMENT TO A PRINT/EDIT WELL
Enter Document or Job Name

[ ]
Enter Stream ID.to be given
[ ]
Enter L/File No.of Print/Edit Well[ ]
Enter 'Y' or number of Line up's [ ] (Only used if Copying to a Printwell)
Enter Device Type if Formatting [ ](Only used if Copying to a Printwell)
Enter Request Type
[ ]

G for Global Document
I for Input Job
O for Output Job
```

## 2. George 2, George 2+

101-4-14-0480

 Example Copy the output job ERRORECS to an Edit File to be called REINPUTS. The TPS Edit Well is Logical File Number 3.

## 4.4.3 Errors

Message	Reason							
Invalid data	<ul> <li>An invalid field has been input.</li> <li>The cursor is positioned at the start of the offending field.</li> </ul>							
Specified record not on file	- The specified job or document does not exist							
Specified record already exists	- A file of the specified name generation zero already exists.							
Unable to proceed at present	- The requested job or document is currently being created.							

101-4.14.1-1179

#### 4.5 XIIP

## 4.5.1 Description

Function Display data from a job or document contained in the Spoolfile or a George 2 or George 2+ Input or Output Well.

Format There are two versions of the XIIP format: one for 2903/4 Spoolfile and one for George 2 and George 2+ systems. These are shown on the following page.

#### Entered fields

#### Mandatory

- Document or job name The Spoolfile (or George 2/George2+ Input/Output) document or job name.
- 2. Request type Type of spool file entry.

  G Global Document
  (2903/4 Spoolfile only)

  I Input Job
  0 Output job

## Optional

Inhibit Central Output? - George 2, George 2+ Systems only. Enter 'Y' if the output from the job to be displayed is not to be printed by the output module. Enter 'N' if the output is to be printed by output module. The output print status of the job remains unaltered if this field is left blank.

The first screenful of data from the job or document will then be displayed. To display the next page just press the 'SEND' key. The end of each document within ajob will be indicated.

In order to skip to the next document XIDS should be entered in the top left-hand corner of the screen and transmitted.

On George 2 or George 2+ systems the input or output well containing the job will be closed when the last page of data has been displayed. In order to close the file early XIDE should be entered in the top left hand corner of the screen and transmitted.

66.2

101-4-14.2-1179

## 4.5.2 Formats

1. 2903/4 Spoolfile

```
Enter Document or Job Name [ ]

Enter Request Type [ ]

G for Global Document

I for Input Job

O for Output Job
```

2. George 2, George 2+

```
Enter Job Name [ ]

Inhibit Central Output? [ ]

Enter Request Type [ ]

I for Input Job

O for Output Job
```

Example
 Display the contents of the Output job named COBOLCOMP.

```
Enter Document of Job Name [ COBOLCOMP ]

Enter Request Type [ o]

G for Global Document

I for Input Job

O for Output Job
```

66.3

101-4-14.3-1179

# 4.5.3 Errors

message	Reason
Invalid Message Length	- Not enough data has been input.
Invalid Request type	- The request type input was not G, I or 0.
Record Not Found	- The specified job or document cannot be found
Print Incomplete on Print	ter - The requested job or document is currently in use.

5. GENERATING A TPS SYSTEM INCLUDING THE INTERACTIVE DEVELOPMENT SYSTEM.

#### 5.1 GENERATION PARAMETERS

The Generation Forms should be completed as described in the System Generation Manual. The following amendments are required to the standard generation parameters in order to include the Interactive Development System.

#### Form 1

To generate Interactive Development System application routines include one of the following parameters on macro £TCAY:

10 - IDS for 2903/4 Spool file 10G2 - IDS for George 2 10G2+ - IDS for George 2+.

This will generate each AR in a different overlay unit of the same overlay area, an overlaying strategy which produces a minimum size program. To greatly improve the performance of the editor it is recommended that the IDS ARs are defined "longhand" on Form 2 as described below and the parameter IO (or IOG2 or IOG2+) omitted from macro £TCAY.

To include the remote printing option of IDS include also the following parameters on macro £TCAY:

PO - for print option functions ZPOD, ZPCF, ZPDA, ZRPW PR - standard print handling.

#### Form 2

- If the parameter PR is not included on macro £TCAY on Form 1 (for Advanced Terminal System), the application routine TPSPMOD16 must be defined using macro £TCAR. This routine, used to initialise the Edit Well during start-up, should be overlaid.
- 2. For improved performance the IDS ARs may be defined using macros £TCAR, with the overlaying strategy defined in the table below. In this table 'a' is the overlay area parameter and 'b' is the base overlay unit number. The Application Routines should be chosen from the appropriate column according to the Operating System being used.

Area	Unit					Function	
		2903/4 Spoolfile	George 2	George 2 +			
a a a	b b+1 b+1	TPSIOCY1 TPSIOCY2 TPSIOCY3	TPSIOGCY1 TPSIOGCY2 TPSIOGCY3	TPSIGPCY1 TPSIOGCY2 TPSIOGCY3	}	Copy job/document from Spoolfile (or input/output wells) to the Edit Well.

#### Form 3

 To generate the standard abort train including the aborting of IDS functions, include the following parameter to the £TCTY macro in Section 6:

10

If for any reason the abort train is defined longhand using macro fTCTR (From 4), in order to include the IDS abort function TPSEDABORT should be specified in the train immediately following TPSJOURNAL.

- Include one of the following parameters for the £TCTY macro in the last section:
  - to generate AR trains for IDS functions using the 2903/4 Spoolfile.

IOG2 - to generate AR trains for IDS functions using George 2.

IOG2+ - to generate AR trains for IDS functions using George 2+.

- To incorporate the remote printing option of IDS, include the following parameter for the £TCTY macro in the last section:-
  - PO to generate AR trains for print option functions ZPOD, ZPCF, ZPDA, ZRPW

#### Form 5

The size defined for the message area must be at least 550 words to allow processing of all IDS functions.

## Form 7

The size defined for the user TCR must be at least 132 words, as certain IDS functions use the last 132 words of the User TCR.

#### Form 9

- 1. For use by IDS, a store cell of at least 512 words must be available.
- 2. The store cell chain defined for the Edit Well must contain at least two store cells. Where several threads may be editing edit files, two cells should be available per thread to avoid the possibility of a deadly embrace. This chain need not be dedicated to use by the Edit Well.
- 3. Two store cells are used as file buffers for each thread editing composite, simple or record files, and for each thread using the XIFU copy function. IPS will obtain the store required from any chain which contains cells of a sufficient size.

#### Form 10.1

- In Section 1 (macro £TCIF) specify a list of Logical File Numbers of "spare" logical files to be used by the Editor and for the XIFU copy function. Allow 2 spare LFN's for every concurrent Edit or Copy. In George 2 or George 2+ systems one of the spare LFN's is also used when opening input or output wells (for functions XISY, XICY etc.)
- 2. In Section 2, (macro £TCIO must be completed with up to 6 parameters as follows:

Logical File Number of the Spoolfile.

Required only for systems using 2903/4 Spoolfile. For George 2 and George 2+ systems this parameter is not needed; a comma should be entered.

Logical File Number of the Edit Well.

Must be specified for all IDS Systems.

Generation numbers for input wells.

For systems using the 2903/4 Spoolfile, these parameters are not required. For George 2 and George 2+ systems these parameters indicate the lowest and highest generation of the input wells to be accessed by IDS. If omitted, input wells with generation numbers 1 to 8 are used.

Generation numbers for output wells.

For systems using the 2903/4 Spoolfile, these parameters are not required. For George 2 and George 2+ systems these parameters indicate the lowest and highest generation of the output wells to be accessed by IDS. If omitted, generation numbers specified for input wells are used.

#### Form 11

Define the Edit Well, the Spoolfile (for 2903/4 users) and the spare LFN's (see Form 10.1 above) on macro £TCDA as type LBNF.

#### Form 12.0

 To generate IDS facilities request codes, include one of the following parameters on macro £TCEF:

IO - IDS for 2903/4 Spoolfile

IOG2 - IDS for George 2

IOG2+ - IDS for George 2+

If the remote printing option of IDS is being used, include also the following parameter on macro £TCEF: 101-5-5-0480

#### Form 12.1

If the remote printing option is to be used, include Sections 5 and 6 (macro £TCPR) with parameters as described in the System Generation Manual.

#### Form 12.3

If the parameter PR is already included on macro £TCOF, no additional parameters are required.

If the parameter PR is not specified, include one of the following parameters on macro £TCOF, to generate IDS software:

IO - IDS for 2903/4 Spoolfile

IOG2 - IDS for George 2

IOG2+ - IDS for George 2+

Form 20 (only required if formats to be held in store).

 To generate formats in store for the IDS functions, include one of the following parameters on macro £TCFY (English formats) or £TCFX (French formats):

IO - IDS for 2903/4 Spoolfile

IOG2 - IDS for George 2

IOG2+ - IDS for George 2+

Formats in store for individual IDS functions may be generated by omitting the parameter IO (or IOG2 or IOG2+) and instead including parameters as required from the following table:

Function	Pa	rameter	
	Spoolfile	George 2	George 2+
Apply edit instructions	XEDT	XEDT	XEDT
Edit data	XEIN	XEIN	XEIN
Copy from Edit Well	XICY	XICYG2	XICYG2+
Display data from Spoolfile or Input/Output well	XIDP	XIDP	XIDP
Input data to edit file	XIEN	XIEN	XIEN
Standard functions	XIFU	XIFU	XIFU
File list	XIGU	XIGU	XIGU
or Input/Output well	XIIP	XIIPGZ	XIIPG2+

101-5.7-0480

Function	Parameter		
Display data from edit file	XILE	XILE	XILE
Create an edit file	XIMS	XIMS	XIMS
Copy to Edit Well	XISY	XISYG2	XISYG2-
File allocation/deallocation	ZFLC	ZFLC	ZFLC

 To generate formats in store for the remote printing options of IDS, include the following parameters on macro £TCFY (English formats) or macro £TCFX (French formats):

PO - print option functions ZPOD, ZPCF, ZPDS, ZRPW

PR - standard print functions XFPR, ZPQR.

#### Form 23A

 To generate IDS standard message type table entries, include one of the following parameters on macro £TCMY:

IO - IDS for 2903/4 Spoolfile

IOG2 - IDS for George 2

IOG2+ - IDS for George 2+

Where the user is changing some of the IDS format identifiers (see Section 5.3), message type table entries for individual functions may be generated by omitting the parameter IO (or IOG2 or IOG2+) and instead including parameters as required from the following list:

Function	Parameter
Apply edit instructions	XEDT.
Edit data	XEIN
Copy from Edit Well	XICY
Display data from Spoolfile or Input/Output well	XIDP
Input data to edit file	XIEN
Standard functions	XIFU
File list	XIGU
Display from Spoolfile or Input/Output well	XIIP
Display data from edit file	XILE
Create an edit file	XIMS
Copy to Edit Well	XISY
File allocation/ deallocation	ZFLC

OTelecomputing Limited 1980

 To generate standard message type table entries for the remote printing option of IDS, include the following parameters on macro fTCMY:

PO - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PR - standard print functions XFPR, ZPQR etc.,

## Form F3 (Formats on disc)

To generate formats on disc for the IDS functions, include one of the following parameters on macrofTCFY (English formats) or fTCFX (French formats)

IO - IDS for 2903/4 Spoolfile

IOG2 - IDS for George 2

IOG2+ - IDS for George 2+

Formats on disc for individual IDS functions may be generated by omitting the parameter IO (or IOG2 or IOG2+) and instead including parameters as required from the following table:

Function	P		
	Spoolfile	George 2	George 2+
Apply edit instructions	XEDT	XEDT	XEDT
Edit data	XEIN	XEIN	XEIN
Copy from Edit Well	XICY	XICYG2	XICYG2+
Display data from Spoolfile or Input/Output well	XIDP	XIDP	XIDP
Input data to edit file	XIEN	XEIN	XIEN
Standard functions	XIFU	XIFU	XIFU
File list	XIGU	XIGU	XIGU
Display from Spoolfile or Input/Output well	XIIP	XIIPG2	XIIPG2+
Display data from edit file	XILE	XILE	XILE .
Create an edit file	XIMS	XIMS	XIMS
Copy to Edit Well	XISY	XISYG2	XISYG2+
File allocation/ deallocation	ZFLC	ZFLC	ZFLC

 To generate formats on disc for the remote printing option of IDS, include the following parameters on macro £TCFY (English formats) or £TCFX (French formats):

PO - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PR - standard option functions XFPR, ZPQR.

Form F5 (Formats on disc)

 To generate format table entries for the IDS functions, include one of the following parameters on macro £TCMY:

IOF - IDS for 2903/4 Spoolfile

IOG2F - IDS for George 2

IOG2+F - IDS for George 2+

Format table entries for individual IDS functions may be generated by omitting the parameter IOF (or IOG2F or IOG2+F) and instead including parameters as required from the following list:

Function	Parameter
Apply edit instructions	XEDT
Edit data	XEIN
Copy from Edit Well	XICY
Display data from Spoolfile or Input/Output well	XIDP
Input data to edit file	XIEN
Standard functions	XIFU
File list	XIGU
Display from Spoolfile or Input/Output well	XIIP
Display data from edit file	XILE
Create an edit file	XIMS
Copy to Edit Well	XISY
File allocation/ deallocation	ZFLC

Io generate format table entries for the remote printing option of IDS, include the following parameters on macro £TCMY:

POF - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PRF - standard print functions XFPR, ZPQR

#### 5.2 TPSM PARAMETERS

TPSM parameters for a TPS program including IDS should be specified as for a standard program - see System Generation manual, Part 2.

Among the file specifications must be included definitions of the following files used by IDS:

Edit Well

Spoolfile (2903/4 Spoolfile version only)

Spare LFN's for Editor/Copy function.

The TPSM parameters for these files are as described for standard files but with the following specific parameters required.

### Edit Well

MAIN nnn

nnn is the Logical File Number as defined on macro £TCIO on Form 10.1.

TYPE OVERLAY

MODE (EDIT, START)

RETE (0,0,0,0,0,)

STOR n

The store chain specified should include at least two store cells

ACCE (READ, WRITE, MYNEXT, SPECIFIC)

# 2. Spoolfile (2903/4 Spoolfile version only)

MAIN nnn

nnn is the Logical File Number as defined on macro £TCIO on Form 10.1.

TYPE INPUT

MODE (SPOOL, START)

RETE (0,0,0,0,0,0)

STOR n

One cell is used as a Spoolfile buffer for each thread processing an IDS function which accesses the Spoolfile.

ACCE (READ, WRITE, MYNEXT, SPECIFIC)

WORK (1,0,1,0)

FILE GEOSPOOLFILE

101-5.10-0480

## "Spare" Logical Files

One specification is required for each of the spare Logical File numbers defined on macro £TCIF, to be used by the Edit and copy functions and when opening George 2 or George 2+ input/output wells.

MAIN nnn

nnn is a 'spare' Logical File Number as defined on macro £TCIF on Form 10.1.

TYPE OUTPUT

MODE (LBNF)

RETE (0,0,0,0,0,0)

STOR n

The chain specified should contain store cells of sufficient size to accommodate the largest bucket size of files which may use the 'spare' LFN, other than files being edited or copied using XIFU. (e.g. George 2/George 2+ input/output wells, Teleload library file if TPS-teleload facility included).

ACCE (READ, WRITE, SPECIFIC, NEXT)

MONI FAIL

WORK (0,0,0,0)

EXTEND (n)

n indicates the number of buckets by which an output file is to be automatically extended when full.

FILE xxxxxxxxxx xxxxxxxx is a dummy file name.

## 4. Examples

Edit Well

TPSM0201 MAIN 3, TYPE OVER, MODE(EDIT, START), RETE (0,0,0,0,0,0)
TPSM0202 STOR 7, ACCE(READ, WRIT, SPEC, MYNEXT), WORK(1,0,1,0)
TPSM0203 FILE TPSEDITWELL

Spoolfile (2903/4 version only)

TPSM0201 MAIN 2, TYPE INPU, MODE (SPOOL, STAR), RETE(0,0,0,0,0,0)
TPSM0202 STOR 2, ACCE(READ, WRIT, SPEC, MYNEXT), WORK(1,0,1,0)
TPSM0203 FILE GEOSPOOLFILE

Spare Logical File

TPSMO201 MAIN 4, TYPE OUTP, MODE(LBNF), RETE(0,0,0,0,0,0)
TPSMO202 STOR 1, ACCE(READ, WRITE, SPEC, NEXT), MONI FAIL
TPSMO203 WORK(1,0,1,0), EXTEND (80), FILE ED

#### 5.3 CHANGING FORMAT IDENTIFIERS

Most of the IDS functions are standard 'X' functions and as such are available to all terminal users. Users may have a requirement to restrict access to certain of the IDS functions; this may be achieved by changing the appropriate IDS format identifiers to identifiers in the user range (i.e. beginning with letters A-W). Users may then gain access to these new functions in the usual way.

The only restriction on changing of identifiers is that if identifier XIDP is changed, the special identifiers XIDE and XIDS may not be used.

To incorporate the identifier changes, the generation parameters should be modified as described below.

#### 5.3.1 Control routine amendments

Form 18 (only required if formats to be held in store)

Any formats for IDS functions with non-standard identifiers which are to be held in store should be defined longhand using the macro £TCFM. All details except the format identifier itself should be identical to those on the corresponding standard IDS format.

Form 20 (only required if formats to be held in store)

Any formats for IDS functions with standard identifiers which are to be held in store may be generated using the parameters described in Section 5.1 above.

#### Form 23

Message type entries for IDS functions with non-standard identifiers are defined longhand using macro £TCMT. All parameters except for the identifier itself should be identical to those generated for the corresponding standard IDS function.

#### Form 23A

Remove the parameter IO (or IOG2 or IOG2+) from macro £TCMY on Form 23A. Message type table entries for IDS function with standard identifiers are generated by including parameters for the individual functions as described in Section 5.1 above.

#### Form 25/Form 26

An additional table is defined at the end of the generation parameters, immediately before the parameter #END. This should have the following format:

101-5.12-1179

#UPPER

TAB

4Hxxxx,4Hyyyy 4Hxxxx,4Hyyyy

-1

#LOWER TPSMTCONV COMMON/TPSMTCONV/

/TAB

where xxxx is a standard IDS identifier yyyy is the replacement identifier.

These pairs of parameters should be repeated for each standard identifier to be changed.

## 5.3.2 Format File

Where formats are held on disc it is recommended that the format file is generated to include all standard versions of the IDS formats. The online format file editing function ZFFL may then be used to change the identifier of the standard format as follows:

- 1. Use copy function to create new format with non-standard identifier.
- 2. Delete standard version of format.

#### 5.4 THE EDIT WELL

The Edit Well should be allocated as a serial file with three-word bucket headers. It is recommended that the Edit Well is allocated as a two-block bucket file for the most efficient use of the space available.

If necessary, the Edit Well is automatically initialised by TPS during start-up procedures. The first bucket of the file is checked; if this is not in Edit Well format the bucket headers of all buckets in the file are reset.

Buckets within the Edit Well are used for two purposes: as index buckets and as data buckets. For each edit file an index record 16 words long is recorded in the index. The data records within an edit file are as entered (with trailing spaces removed), with a word count added to each record. Buckets for the index, for each edit file, and "free" buckets are chained together, using the third word of the bucket header to indicate the next bucket in a chain.

Users should ensure that the Edit Well allocated is of adequate size to hold all required edit files: there is no facility for extending the size of an edit file. If an additional file area is allocated the extra buckets are not utilised by IDS as they are not specified in its chain of "free" buckets. If it becomes necessary to increase the size of the Edit Well, the following steps are necessary:

- use IDS to copy all edit files which are to be kept from the Edit Well to the Spoolfile (or Input/Output wells)
- allocate a larger Edit Well.
- ensure that the first bucket of the new Edit Well is not in Edit Well format.
- load the IDS program. Start-up routines will initialise the Edit Well.
- copy edit files from Spoolfile (or Input/Output wells) into the new Edit Well.

#### 6.1 INTRODUCTION

The Remote Printing from spool files option provides facilities to allow printing of documents or jobs held in the 2903/4 Spoolfile (or George 2 or George 2+ input or output wells) at a remote printer attached to a TPS program. This is achieved using the following TPS functions:

IDS-0480

- XISY to transfer a job or document from the Spoolfile (or George 2 or George 2+ Input or Output Well) into a TPS Print Well. If required, while being transferred the data is reformatted for output to the remote printer.
- ZPOD to request output of a job or document from the Print Well to a specified printer.
- ZPAD to amend an output request input via the ZPOD function.
- ZPCF to control the printing; this allows the user to suspend, resume or cancel a print output request, to alter the priority of an output request, or to delete a job or document from the Print Well.
- ZRPW to reset the Print Well to its initial state, deleting any jobs or documents currently held in the well.

The remainder of Section 6 describes in detail the use of each of these functions.

In addition to these functions which form the Remote Printing facility, several standard TPS functions are supplied to assist in the controlling of terminal printer devices. These functions (XFPR, ZPQR and "control" functions) are fully described in the TPS System Designers Manual (for users of the full TPS system) or the TPS Free-Standing Program Operating Manual.

6.2 TRANSFER OF SPOOL FILE DATA FOR REMOTE PRINTING : FUNCTION XISY

This function copies a job or document from the Spoolfile or a George 2 or George 2+ Input or Output Well into a TPS Print Well.

IDS-0480

## 6.2.1 Format displayed in Response to XISY

On entry of XISY in the first four character positions of the screen, the appropriate version of the format as shown below is displayed, according to the operating environment.

The record of the "last restart" and "previous" screens is preserved.

1. 2903/4 Spoolfile

XISYI									
COPY A JOB OR Enter Document or Job Wame	DO	oct	UMENT TO	A PR	INT	/EDIT WE	LL		
Enter Stream ID.to be given	1			)					
Enter L/File No.of Print/Edit Well	11		1						
Enter 'Y' or number of Line up's	[		] (Only	used	if	Copying	to	a	Printwell)
Enter Device Type if Formatting	E		1(Only	used	if	Copying	to	a	Printwell)
Enter Request Type	E	1							
6 for Global Document									
I for Input Job									
O for Output Job									

## 2. George 2, George 2+

XISY] COPY A JOB TO A PRINT/EDIT WELL Enter a Job Name Enter Stream ID to be given ] Enter L/File No. of Print/Edit Well[ Enter 'Y' or number of Line up's [ ] (Only used if Copying to a Printwell) Enter Device Type if Formatting [ ](Only used if Copying to a Printwell) Inhibit Central Output? [ ] Enter Request Type [ ] I for Input Job O for Output Job

## 6.2.2 Completion of the XISY Screen

On display of the XISY format, details are entered as follows:

Document or job name

: the name of the document or job to be copied from the Spoolfile or George 2/ George 2+ Input/Output Well.

Stream ID to be given

: the name of the Print Stream that is to be created to receive the input; if omitted a Print Stream is created with the document or job name specified.

Logical File Number

: the logical file number of the TPS Print Well into which the job or document is to be copied.

Number of line ups

: this field is completed if line-up records are to be created in the Print Stream.

Blank - no line-up records are to be created

n (numeric) - the first n records in the job or document are to be line-up records in the Print Stream.

- records within the job or

IDS-0480

document which have been marked as line-up records by the operating system, are to be copied as line-up records in the Print Stream.

Device Type

: this field is completed if data is to be formatted and buffered when copying to the Print Well.

Blank - records from the job or document are transferred to the Print Well without formatting.

TERM - when copying into the Print Well, the data is formatted as appropriate for a 7502 terminal printer.

Inhibit Central Output?

: George 2, George 2+ systems only. This may be used to alter the output print status of the job being copied.

Blank - the output print status of the job remains unaltered.

 output from the job being copied to the Print Well is not to be printed by the output module.

N - output from the job being copied to the Print Well is to be printed by the output module.

Request type

: Type of Entry to be copied.

G - Global document (2903/4 Spoolfile only)

I - Input job
0 - Ouptut job.

## 6.2.3 Example

Copy the output job ERRORECS to a Print Stream called ABERRORECS in TPS Print Well Logical File Number 2 for printing on a 7502 berminal printer. No line-ups are required.

COPY A JOB OR DOCUMENT TO A PRINT/EDIT WELL
Enter Document or Job Name

[ERRORECS ]

Enter Stream ID.to be given

[ABERRORECS ]

Enter L/File No.of Print/Edit Well[27 ]

Enter 'Y' or number of Line up's [ ] (Only used if copying to a Printwell)

Enter Device Type if Formatting

[TERM] (Only used to copying to a Printwell)

Enter Request Type

[O]

G for Global Document

I for Input Job

O for Output Job

## 6.2.4 Action by the System on Receipt of the Completed XISY Screen.

#### 6.2.4.1 Validation

The fields input are checked to ensure that they are valid. Where an error is found, one of the following messages is displayed on the line specified for TPS messages (usually line 1), and the cursor positioned at the field in error:

- FIELD MISSING
   A mandatory field has been completed.
- INVALID DATA
   A field has been completed with an incorrect parameter.
- SPECIFIED RECORD NOT ON FILE
   The specified job or document cannot be located within the spoolfile
   (or the range of George 2/George2+ Input/Output Wells specified to
   be used by TPS functions).
- SPECIFIED STREAM ALREADY EXISTS
   The specified print stream already exists within the nominated Print Well.
- UNABLE TO PROCEED AT PRESENT The requested job or document is currently being created.

IDS-0480

## 6.2.4.2 Copying of data to the Print Well

Where all fields input are valid, the message 'CONFIRMED' is displayed on the line specified for TPS messages (usually line 1) before the copy commences. The terminal may then be used for other functions whilst the copy is in progress.

The copying of data is governed by the device type parameter entered. Where this field is left blank, records from the job or document are transferred to the Print Well without formatting. Each record within the job or document becomes a print item.

Where the device type 'TERM' is specified, the data copied is formatted as appropriate for a 7502 terminal printer. In formatting the data, characters within the job or document records are interpreted as follows:

- \$ converted to TT
- ] converted to TU
- ↑ converted to N
- ← converted to /W

In addition, printer control characters are converted to control characters appropriate to the termiprinter.

Records from the job/document are grouped into print items; the maximum size print item created is 128 characters. A print restart point is created for each throw to Channel-1.

#### 6.2.4.3 Response on completion of copy

On successful completion of the copy to the Print Well a message:

XXXXXXXXXXXXX COPY COMPLETED

(where xxxxxxxxxx is the job or document which has been copied) is displayed on the line specified for TPS messages (usually line 1). This message also activates the audible terminal alarm.

6.3 REQUEST OUTPUT OF PRINT DATA : FUNCTION ZPOD

This function is used to request output of a Print Stream to a specified printer.

## 6.3.1 Format displayed in response to ZPOD

On entry of ZPOD in the first four character positions the system will check for Master or System Status if this has been specified as a requirement at system generation time. If the correct status is not held, the password prompt is displayed for entry of the system password. If the correct status is held, the format shown below is displayed.

The record of the 'last restart' and 'previous' screens is preserved.

ZPOD] TPS STANDARD PRINTER FUNCTIONS - REQUEST OUTP	UT 0	F	A PRINT	STREAM
Logical File Number	1		]	
Stream Identifier	[			3
Demand Identifier	0			1
Priority (0-4095) (Defiault 0)	I		3	
Destination Terminal Number	[		3	
Preamble/Postscript Indicator(Default Value 0) 0=No 1=Yes 2=Confirmation 3=Yes+Confirmation	[	1		
If Destroy Required Enter Number of Restarts to Save (Default - Do not Destroy)	ſ	]		
Print by section (Y,N or R) (Default Value N) (R=Release at Section End)	I	]		

## 6.3.2 Completion of the ZPOD Screen

On display of the ZPOD screen, details are entered as follows:

Logical File Number : the Logical file number of the TPS Print

Well which holds the stream to be output.

Stream identifier : the name of the Print Stream that is to be output (i.e. as used for the XISY copy

function).

IDS-0480

Demand identifier

: the name of the print demand to be created requesting output of the Print Stream.

Priority

: this may be completed to control the sequence of output of demands to a single printer (the demand with highest priority is serviced first). If omitted, a priority

of zero is assigned.

Destination terminal

: the TPS identifier of the printer to which the stream is to be output.

Preamble/Postscript indicator

: may be entered to cause printing of preamble or postscript, or confirmation of output.

Blank or 0 - no action

- report will be preceded and followed by a page containing the stream identifier for identification purposes.

- confirmation of completion of the print will be output to the terminal which input the ZPOD.

3 - combines the functions 1 and 2.

Destroy depth

: may be entered if the stream is to be deleted from the Print Well as it is printed. Enter a value in the range 1 to 8 to indicate the number of 'restart points' (i.e. pages) to be retained for restart purposes. If omitted, the stream is not destroyed.

Print by section

: leave this field blank.

#### 6.3.3 Example

Output the Print Stream ABERRORECS held in Print Well Logical File Number 2 to printer number 8. No special demand identifier and priority are required. Preamble and postscript prints are required, and the completion of print is to be confirmed to the originating terminal. The stream is to be destroyed as it is printed, but retaining 4 pages for restart purposes.

				_
ZPOD] TPS STANDARD PRINTER FUNCTIONS REQUEST OUTPU	T OF	A PRINT	STREAM	
Logical File Number	[2	3

Print by Section (Y,N or R) (Default Value N) (R=Release at Section End)	[ ]			

# 6.3.4 Action of the System on Receipt of the Completed ZPOD Screen

#### 6.3.4.1 Validation

The fields input are checked to ensure that they are valid. Where an error is found, one of the following messages is displayed on the line specified for TPS messages (usually line 1), and the cursor positioned at the field in error:

- INSUFFICIENT DATA
   A mandatory field has not been completed.
- INVALID DATA
   A field has been completed with an incorrect parameter.
- LEVEL 1 ERROR #0001
   The specified stream is not present in the Print Well.
- LEVEL 1 ERROR #0002 Invalid demand identifier.
- LEVEL 1 ERROR #0003
   The Print Well specified is unavailable at present.

IDS-0480

- LEVEL 1 ERROR #0004
   An output request with the specified demand identifier is already present in the print well.
- LEVEL 1 ERROR #0005
   The specified stream is being destroyed, so further output requests cannot be accepted.

# 6.3.4.2 Processing the request for output

Where all fields input are valid, details of the request for output are created as a 'print demand record' on the Print Well. The request is then placed on a queue relating to the nominated printer, according to the demand priority specified. If the printer is not in use, printing commences immediately; otherwise printing will begin when the printer becomes available. The "controlling" terminal, which receives any messages relating to the output (e.g. Fix printer, Check line-ups etc) is the terminal which input the ZPOD function.

# 6.4 AMEND OUTPUT REQUEST PARAMETERS : FUNCTION ZPDA

This function is used to amend the output request parameters (i.e. 'print demand') input using function ZPOD.

# 6.4.1 Format displayed in response to ZPDA

On entry of ZPDA in the first four character positions the system will check for Master or System Status if this has been specified as a requirement at system generation time. If the correct status is not held, the password prompt is displayed for entry of the system password. If the correct status is held, the format shown below is displayed.

The record of the 'last restart' and 'previous' screens is preserved.

DE	MAND	DECODE
	טאאניו	RECORD
[	]	
1		1
Ľ		3
I	3	
[	1	
	C C C	[ ] [ ]

# 6.4.2 Completion of the ZPDA Screen

On display of the ZPDA screen, details are entered as follows:

- Logical File Number : the Logical File number of the TPS Print
  Well holding the stream for which the
  request parameters are to be output.
- Stream identifier : the name of the Print Stream for which the output request parameters are to be amended.
- Demand identifier : the name of the print demand requesting output of the stream which is to be amended.
- New destination terminal number : the TPS identifier of the printer to which the stream is now to be output. If omitted, the stream is output to the terminal last specified using ZPOD or ZPDA functions.
- New Controlling terminal : the TPS identifier of the terminal which is number to control the output (i.e. receive responses

relating to the output). If omitted, the controlling terminal is the last specified using the ZPDA function (or the terminal which input the ZPOD function if no previous ZPDA has been issued).

# 6.4.3 Example

Amend the output request relating to print stream ABERRORECS in Print Well logical file number 2, so that the output is now directed to printer number 10 and controlled by terminal 12.

ZPDA] TPS STANDARD PRINTER FUNCTIONS -	AMEND A PRINT DEMAND RECORD
	0
Logical File Number	[2 ]
Stream Identifier	[ABERRORECS ]
Demand Identifier	[ ]
New Destination Terminal Number (Printer)	[10 ]
New Controlling Terminal Number	[12 ]

# 6.4.4 Action of the system on Receipt of the Completed ZPDA Screen

#### 6.4.4.1 Validation

The fields input are checked to ensure that they are valid. Where an error is found, one of the following messages is displayed on the line specified for TPS messages (usually line 1), and the cursor positioned at the field in error:

- INSUFFICIENT DATA
   A mandatory field has not been completed.
- INVALID DATA
   A field has been completed with an incorrect parameter.
- LEVEL 1 ERROR #0003
   Print Well unavailable at present.
- LEVEL 1 ERROR #0010
   No output request (i.e. demand record) with the specified identifier is present in the Print Well).
- LEVEL 1 ERROR #0016
   The new destination terminal specified is the same as the current one.

- LEVEL 1 ERROR #0017
   The new controlling terminal specified is the same as the current one.
- LEVEL 1 ERROR #0020
   The output request cannot be amended as output is currently in progress to the old destination terminal.

### 6.4.4.2 Amending the output request

Where all fields input are valid, the parameters for the output request (i.e. the 'print demand record') are amended according to the data input. The amended request is then scheduled for output to the nominated printer, according to its demand priority.

94 IDS-0480

#### 6.5 CONTROL OF THE PRINT : FUNCTION ZPCF

This function is used to control the printing, and allows the user to suspend, resume or cancel a print output request, to reset the priority of an output request of to delete a stream from the print well.

# 6.5.1 Format displayed in response to ZPCF

On entry of ZPCF in the first four character positions the system will check for Master or System Status if this has been specified as a requirement at system generation time. If the correct status is not held, the password prompt is displayed for entry of the system password. If the correct status is held, the format shown below is displayed.

The record of the 'last restart' and 'previous' screens is preserved.

ZPCF]				
TPS STANDARD PRINTER FUNCTIONS Function	[ ]			
Logical File Number	Ι	1		
Stream Identifier	I		3	
Demand Identifier	Γ		1	
Priority (0-4095) (Default 0)	1	1		
Restart Point (Default to Current Position)	1	3		
Line-up Records to be Repeated ? (Y or N) (Default N)	[ ]			
Function types :-				
C Cancel a Print Demand D Delete a Print Stream				*
P Reset the Priority of a Print Demand R Resume a Print Demand S Suspend a Print Demand				

## 6.5.2 Completion of the ZPCF screen

On display of the ZPCF screen, details are entered as follows:

Function

: the function which is to be performed; this must be from the following list.

C - cancel an output request ('print demand')

D - delete a print stream

P - reset the priority of an output request

R - resume an output request

S - suspend an output request.

Logical File Number

: the logical file number of the TPS Print Well holding the stream for which the function is to be performed.

Stream identifier

: the name of the print stream for which the function is to be performed.

Demand identifier

: the name of the print demand requesting output of the stream, for which the function is to act. This parameter is not applicable for function 'D', and must be left blank for this function.

Priority

: this must be left blank for all functions except 'P'. For function 'P' this gives the new priority to be assigned to the output request. If omitted for function 'P', a priority of zero is given.

Restart point

: this must be left blank for all functions except 'R'. For function 'R' this defines the position within the stream at which printing is to restart. The contents of this field have the following significance:

Blank : restart the print at the current point (i.e. without reprinting any data)

Positive (unsigned) number: this indicates the number of restart points (i.e. pages) from the start of the stream at which printing is to recommence. The use of this is not recommended if the stream is being destroyed whilst printing, as in this case the required restarts point is calculated from the start of the partial stream remaining.

Negative (signed) number: this gives the number of restart points (i.e. pages) to be reprinted when the print output is restarted. If the stream is being destroyed whilst printing, the value specified should not be greater than the destroy depth specified on function ZPOD.

IDS-0480

Line-up records to be repeated

: this must be left blank for all functions except 'R'. For function 'R' this specifies whether or not any line-up records present in the stream are to be reprinted before resuming printing of the data: specify 'Y' for line-ups, 'N' for no line-ups. If omitted for function 'R', line-up records are not printed.

# 6.5.3 Example

Resume the output request for Print Stream ABERRORECS held in Print Well logical file number 2. Two pages are to be reprinted when the print is restarted. No line-up procedure is needed.

ZPCF]		
TPS STANDARD PRINTER FUNCTIONS		
Function	[R]	
Logical File Number	[2]	
Stream Identifier	[ABERRORECS	3
Demand Identifier	C	1
Priority (0-4095) (Default 0)	[ ]	
Restart Point (Default to Current Position)	[-2 ]	
Line-up Records to be Repeated ? (Y or N) (Default N)	[ ]	
Function types :-		0
C Cancel a Print Demand		
D Delete a Print Stream		
P Reset the Priority of a Print Demand		
R Resume a Print Demand		
S Suspend a Print Demand		

# 6.5.4 Action of the system on Receipt of the Completed ZPCF Screen

# 6.5.4.1 Validation

The fields input are checked to ensure that they are valid. Where an error is found, one of the following messages is displayed on the line specified for TPS messages (usually line 1), and the cursor positioned at the field in error:

- INSUFFICIENT DATA
   A mandatory field has not been completed.
- INVALID DATA
   A field has been completed with an incorrect parameter.
- FILE UNAVAILABLE Print well unavailable at present
- LEVEL 1 ERROR #0001
   No stream with the specified identifier is present in the print well.
- LEVEL 1 ERROR #0003
   Print Well unavailable at present.
- LEVEL 1 ERROR #0010
   No output request (i.e. demand record) with the specified identifier is present in the print well.
- LEVEL 1 ERROR #0012 Nominated restart point not present in the stream (Function 'R' only)
- LEVEL 1 ERROR #0013
   The output request (i.e. demand) cannot be resumed as it is not currently suspended (Function 'R' only).
- LEVEL 1 ERROR #0014
   The stream cannot be deleted as there are output requests outstanding for it. (Function 'D' only).
- LEVEL 1 ERROR #0015
   The stream is already being deleted (Function 'D' only)

# 6.5.4.2 Cancelling an output request

Details of the specified output request (i.e. print demand record) are removed from the Print Well. No printing of the stream will take place unless another output request is made using function ZPOD.

Processing is completed by the display of the message 'CONFIRMED' on the line specified for TPS messages (usually line 1).

### 6.5.4.3 Deleting a print stream

The nominated print stream is removed from the Print Well.

# 6.5.4.4 Resetting the priority of an output request

The priority of the specified output request (i.e. print demand record) in the Print Well is amended. The amended request is then scheduled for output according to the new priority.

Processing is completed by the display of the message 'CONFIRMED' on the line specified for TPS messages (usually line 1).

# 6.5.4.5 Resuming an output request

The specified output request is scheduled for printing at the appropriate printer according to its priority. When printing of the stream is restarted, line-up records will be repeated if requested; the print will start at the specified restart point with respect to the place reached at the time the output was suspended.

Processing is completed by the display of the message 'CONFIRMED' on the line specified for TPS messages (usually line 1).

# 6.5.4.6 Suspending an output request

The specified request is marked in the Print Well as suspended; if printing of the output was in progress, this is terminated and the printer released to service other output requests. The output request is not subsequently scheduled for printing until a resume function is input for the request.

#### 6.6 RESET THE PRINT WELL: FUNCTION ZRPW

This function is used to reset the Print Well to its initial state.

## 6.6.1 Format displayed in response to ZRPW

On entry of ZRPW in the first four character positions the system will check for Master or System Status if this has been specified as a requirement at system generation time. If the correct status is not held, the password prompt is displayed for entry of the system password. If the correct status is held, the format shown below is displayed.

The record of the 'last restart' and 'previous' screens is preserved.

ZRPW]

TPS STANDARD PRINTER FUNCTIONS - RESET A PRINTWELL

Logical File Number

[ ]

# 6.6.2 Completion of the ZRPW Screen.

On display of the ZRPW screen, the logical file number of the TPS Print Well to be reset is entered in the single field.

#### 6.6.3 Example

Reset the TPS Print Well, logical file number 2.

ZRPW]

TPS STANDARD PRINTER FUNCTIONS - RESET A PRINTWELL

Logical File Number

[2]

# 6.6.4 Action of the System on Receipt of the Completed ZRPW Screen

#### 6.6.4.1 Validation

The field input is checked to ensure that it is valid. Where an error is found, one of the following messages is displayed on the line

#### IDS-0480

100

specified for TPS messages (usually line 1):

- FIELD MISSING The logical file number has not been completed.
- INVALID DATA
   The logical file number is not in correct format.
- FILE UNAVAILABLE Print Well not available at present
- LEVEL 1 ERROR #0003
   Print Well not available at present

### 6.6.4.2 Resetting the Print Well

The Print Well is reset to its initial empty status. All print streams within the Print Well are destroyed by this function.

# 7. GENERATING A TPS SYSTEM INCLUDING THE REMOTE PRINTING OPTION

This section describes the generating of a TPS System including the remote printing option but omitting the remainder of IDS.

Refer to Section 5 of this manual if the remote printing option is to be included alongside IDS.

### 7.1 GENERATION PARAMETERS

The Generation Forms should be completed as described in the System Generation Manual. The following amendments are required to the standard generation parameters in order to include the Remote Printing option.

### Form 1

To generate application routines for the Remote Printing option include parameters as required from the following list:

PO - for print option functions ZPOD, ZPCF, ZPDA, ZPRW

PR - for standard printer handling

RP - remote printing for 2903/4 Spoolfile

RPG2 - remote printing for George 2

RPG2+ - remote printing for George 2+.

## Form 3

 To generate the standard abort train including the aborting of Remote Printing functions, include the following parameter to the £TCTY macro in Section 6:

RP

- Include parameters as required from the following list for the £TCTY macro in the last section:
  - PO to generate AR trains for print option functions ZPOD, ZPCF, ZPDA, ZRPW
  - RP to generate AR trains for remote printing functions using 2903/4 Spoolfile.
  - RPG2 to generate AR trains for remote printing functions using George 2
  - RPG2+ to generate AR trains for remote printing functions using George 2+.

## Form 5

The size defined for the message area must be at least 550 words to allow processing of remote printing functions.

IDS-0480

## Form 7

The size defined for the user TCR must be a least 132 words, as certain IDS function use the last 132 words of the user TCR.

### Form 9

- For use by the remote printing software, a store cell of at least 512 words must be available.
- One store cell is used as a print well file buffer for each thread copying data into the print well (function XISY).

## Form 10.1

- Section 1 (macro £TCIF) is required only for George 2 or George 2+ systems. Specify a list of Logical File Numbers of "spare" logical files to be used when opening input or output wells. Allow one spare LFN for every concurrent function using input or output wells.
- In Section 2, macro £TCIO must be completed with up to 6 parameters as follows:

Logical File Number of the Spoolfile

Required only for systems using 2903/4 Spoolfile. For George 2 and George 2+ systems this parameter is not needed; a comma should be entered.

Logical File Number of the Edit Well.

Not required for remote printing; enter a comma only.

Generation numbers for the input wells.

For systems using the 2903/4 Spoolfile, these parameters are not required. For George 2 and George 2+ systems these parameters indicate the lowest and highest generation of the input wells to be accessed by the remote printing software. If omitted, input wells generation numbers 1 to 8 are used.

Generation numbers for the output wells.

For systems using the 2903/4 Spoolfile, these parameters are not required. For George 2 and George 2+ systems these parameters indicate the lowest and highest generation of the output wells to be accessed by remote printing software. If omitted, generation numbers specified for input wells are used.

#### Form 11

Define the Print Well, the Spoolfile (for 2903/4 users) and the spare LFN's (for George 2 and George 2+ users; see Form 10.1 above) as type LBNF.

# Form 12.0

To generate facility request codes for remote printing, include parameters from the following list on macro £TCEF:

PR - printer handling

RP - remote printing for 2903/4 Spoolfile

RPG2 - remote printing for George 2

RPG2+ - remote printing for George 2+.

### Form 12.1

Include Sections 5 and 6 (macro fTCPR) with parameters as described in the System Generation Manual.

### Form 12.3

Include the following parameter on macro. £TCOF, to generate print handling software:

PR

Form 20 (only required if formats are to be held in store).

To generate formats in store for the remote printing functions, include parameters as required from the following list on macro £TCFY (English formats) or £TCFX (French formats):

PO \_ - print option functions ZPOD, ZPCF, ZPDA, XPRW

PR - standard print functions XFPR, ZPQR

RP - remote print functions for 2903/4 Spoolfile

RPG2 - remote print functions for George 2

RPG2+ - remote print functions for George 2+

### Form 23A

To generate remote printing message type entries, include on macro £TCMY parameters as required from the following list:

PO - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PR - standard print functions XFPR, ZPQR, etc.,

RP - remote print functions for 2903/5 Spoolfile

RPG2 - remote print functions for George 2

RPG2+ - remote print functions for George 2+

IDS-0480

# Form F3 (Formats on Disc)

To generate formats on disc for the remote printing functions, include parameters as required from the following list on macro £TCFY (English formats) or £TCFX (French formats):

PO - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PR - standard print functions XFPR, ZPQR

RP - remote print functions for 2903/4 Spoolfile

RPG2 - remote print functions for George 2

RPG2+ - remote print functions for George 2+

# Form F5 (Formats on Disc)

To generate format table entries for the remote printing functions, include on macro £TCMY parameters as required from the following list:

POF - print option functions ZPOD, ZPCF, ZPDA, ZRPW

PRF - standard print functions XFPR, ZPOR

RPF - remote print functions for 2903/4 Spoolfile

RPG2F - remote print functions for George 2

RPG2+F - remote print functions for George 2+

#### 7.2 TPSM PARAMETERS

TPSM parameters for a TPS program including the remote printing option should be specified as for a standard program - see System Generation manual, Part 2.

Among the file specifications must be included definitions of the following files used by the remote printing software:

Print Well

Spoolfile (2903/4 Spoolfile version only)

Spare LFN's for Input/Output Wells (George 2, George 2+ versions only)

The TPSM parameters for these files are as described for standard files but with the following specific parameters required:

### 1. Print Well

MAIN nnn

nnn is the Logical File Number as defined on macro £TCDA on Form 11.

TYPE OVERLAY

MODE (PRTS, START)

RETE (0,n,m,0,0,0)

This gives retention values n and m to the stream index and demand index buckets respectively.

STOR n

The store chain specified should include at least two store cells. For better performance sufficient cells should be available to allow stream and demand indexes to be held in store. (Size of indexes: 16 words per stream,

33 words per demand).

ACCE (READ, WRITE)

# Spoolfile (2903/4 Spoolfile version only)

MAIN nnn

nnn is the Logical File Number as defined on macro fTCIO on Form 10.1

TYPE INPUT

MODE (SPOOL, START)

RETE (0,0,0,0,0,0)

STOR n

One cell is used as a Spoolfile buffer for each thread processing a remote printing function which accesses the Spoolfile.

ACCE (READ, WRITE, MYNEXT, SPECIFIC)

WORK (1,0,1,0)

FILE GEOSPOOLFILE

# 3. "Spare" Logical Files (George 2, George 2+ versions only)

One specification is required for each of the spare Logical File numbers defined on macro £TCIF, to be used by the remote printing functions when opening George 2 or George 2+ input/output wells.

MAIN nnn

nnn is the 'spare' Logical File Number as defined on macro £TCIF on Form 10.1

TYPE (OUTPUT)

MODE (LBNF)
RETE (0,0,0,0,0,0)

STOR n

The chain specified should contain store cells of sufficient size to accommodate the largest bucket size of the files which may use the 'spare' LFN. (e.g. George 2/George 2+ input/output wells, Teleload library file if TPS-teleload facility included).

ACCE (READ, WRITE, SPECIFIC, NEXT)

MONI FAIL

WORK (0,0,0,0)

EXTEND (n)

n indicates the number of buckets by which an output file is to be automatically extended when full.

FILE XXXXXXXXXXX XXXXXXXXXXX is a dummy file name.

## Examples

Print Well

TPSM0201 MAIN 2, TYPEOVER, MODE(PRTS,STAR), RETE(0,4,5,0,0,0)
TPSM0202 STOR 3, ACCE(READ,WRITE), WORK(1,0,1,0)
TPSM0203 FILE TPSPRINTWELL

Spoolfile (2903/4 version only).

TPSM0201 MAIN 3, TYPE INPU, MODE (SPOOL, STAR), RETE(0,0,0,0,0,0)
TPSM0202 STOR 2, ACCE(READ, WRIT, SPEC, MYNEXT), WORK(1,0,1,0)
TPSM0203 FILE GEOSPOOLFILE

Spare Logical File (George 2, George 2+ versions only)

TPSM0201 MAIN 4, TYPE OUTP, MODE(LBNF), RETE(0,0,0,0,0)
TPSM0202 STOR 1, ACCE(READ, WRITE, SPEC, NEXT), MONI FAIL
TPSM0203 WORK(1,0,1,0), EXTEND (80), FILE ED
